

# Southwest Florida Water Management District 2022 Estimated Water Use Report

*The Southwest Florida Water Management District (District) does not discriminate on the basis of disability. This nondiscrimination policy involves every aspect of the District's functions, including access to and participation in the District's programs, services and activities. Anyone requiring reasonable accommodation, or who would like information as to the existence and location of accessible services, activities, and facilities, as provided for in the Americans with Disabilities Act, should contact the Human Resources Office Chief, at 2379 Broad St., Brooksville, FL 34604-6899; telephone (352) 796-7211 or 1-800-423-1476 (FL only); or email [ADACoordinator@WaterMatters.org](mailto:ADACoordinator@WaterMatters.org). If you are hearing or speech impaired, please contact the agency using the Florida Relay Service, 1-800-955-8771 (TDD) or 1-800-955-8770 (Voice). If requested, appropriate auxiliary aids and services will be provided at any public meeting, forum, or event of the District. In the event of a complaint, please follow the grievance procedure located at [WaterMatters.org/ADA](http://WaterMatters.org/ADA).*

---

Data used by this report was collected for specific permits by the Southwest Florida Water Management District from various sources and methods. The data obtained from the District's databases may be provisional and thus subject to revision. The District does not warrant, guarantee, or make any representations regarding the use, or the results of the use, of the data in terms of correctness, accuracy, reliability, completeness, usefulness, timeliness or otherwise and the District specifically disclaims any warranty, either expressed or implied, including but not limited to the implied warranties of merchantability and fitness for a particular use. The data is provided "as is" and the entire risk as to quality and performance is with the user. In no event will the District be liable for any direct, indirect, incidental, special, consequential, or other damages, including loss of profit, arising out of the use of these data even if the District has been advised of the possibility of such damages. All data are intended for the District's use. These data do not represent an endorsement or recommendation. If you have any questions concerning these data, contact the Water Resources Bureau at (352) 796-7211 or 1-800-423-1476 (Florida).

# 2022 ESTIMATED WATER USE REPORT

## EXECUTIVE SUMMARY

The Estimated Water Use (EWU) Report summarizes the withdrawal and use of water from natural resources in the Southwest Florida Water Management District (District). The EWU Report is a source for a variety of water supply planning and management purposes; however, it's independent of the District's compliance evaluation for conditions of water use permits (WUPs). The report is based primarily on statistical analyses of metered pumpage records in the District's Water Management Information System (WMIS). Metered sources account for 85 percent of the total withdrawals reported.

The EWU Report quantifies water withdrawals and use under the predominant use categories listed in Table ES-1 below.

**Table ES-1. Districtwide Water Withdrawals and Use (mgd) in 2022.**

Category	Withdrawal	Use
Public Supply	601.7	578.4
Domestic Self Supply	39.3	39.3
Landscape/Recreation	57.8	57.8
Agriculture	329.2	329.2
Mining/Dewatering	17.8	17.8
Industrial/Commercial	60.2	60.2
Institutional & "Other"	4.2	4.2
<b>Total</b>	<b>1,110.2</b>	<b>1,086.9</b>

Source: Table 9. Rounding discrepancies occur.

For all categories except public supply, the quantity of water withdrawn is assumed to be the amount used, since the water was likely withdrawn at the same time and general location of its use. Public supply withdrawals are often transferred regionally, stored seasonally, and are subject to treatment and distribution losses; so, the quantity and spatial use can vary significantly.

As shown, the total amount of water withdrawn in the District from natural resources was 1,110.2 mgd. The total water used was 1,086.9 mgd. Most withdrawals were for public supply at 54 percent of total withdrawals, followed by agriculture at 30 percent of withdrawals.

### PUBLIC SUPPLY

The public supply use category includes public water systems, regional water supply authorities, privately held water utilities, and other entities

that provide potable water to an identifiable population. It also includes water used by commercial businesses and industries that received water from utilities.

The 601.7 mgd of public supply withdrawals in 2022 are up from the 599.4 mgd in 2021. After accounting for changes in storage and losses from treatment and transmission, the public supply use quantity is 578.4 mgd, which is also up from the 575.4 mgd used in 2021.

The water used for public supply was distributed to a functional population of approximately 5.7 million persons. The unadjusted gross use per person was 100 gallons per capita per day (gpcd) Districtwide. When applying various deductions described in pages 19-20, the "adjusted gross per capita" was 99 gpcd, the "compliance per capita" was 94 gpcd, and the "residential per capita" was 70 gpcd.

### DOMESTIC SELF-SUPPLY

The District does not regulate or meter domestic self-supply withdrawals, so this category is wholly estimated. An estimated rural population of 521,833 persons living outside of utility service areas used 39.3 mgd from their domestic wells, based on the average countywide residential use per capita from public supply.

### LANDSCAPE/RECREATION

The landscape/recreation use category is for irrigation of large landscapes such as golf courses, municipal common areas, cemeteries, sports playing fields, and botanical gardens. It also includes consumptive uses at theme parks and other attractions. The quantity does not include repumped water from holding ponds blended with reclaimed water or other alternative sources. The annual average withdrawals were 57.8 mgd, which is slightly down from 58.0 mgd in 2021. Golf course play areas account for 47 percent of this water use.

### AGRICULTURE

The agriculture use category includes water for irrigation and establishment of crops, along with crop freeze protection, fertigation/chemigation, irrigation system maintenance, on-site washing and packing of products, animal watering and cleaning, and other uses. The average use in 2022 was 329.2 mgd, which was up from 322.8 mgd in 2021. Citrus crops accounted for 55 percent of the agriculture use total.

## **2022 ESTIMATED WATER USE REPORT**

### **MINING/DEWATERING**

Mining/dewatering operations recirculate much of the water used on-site and utilize alternative water sources if available; the quantities herein represent only the water consumed from natural resources. Consumptive uses include on-site processing of mined materials, non-recycled or make-up slurry transport water, dewatering quantities that are discharged off-site, water entrained with the product, and water for potable/sanitary use by employees. The annual average use in 2022 was 17.8 mgd, which was up from 14.6 mgd in 2021. Phosphate mining accounted for 97 percent of the mining/dewatering total.

### **INDUSTRIAL/COMMERCIAL**

The industrial/commercial use category is for self-supplied water used by industries and businesses. It includes product manufacturing, off-site phosphate processing, food and beverage processing and packing, power generation, evaporative cooling systems, and various commercial operations. The average industrial/commercial use in 2022 was 60.2 mgd, which was up from 58.9 mgd in 2021. Off-site phosphate processing accounted for 35 percent of the total, and power generation uses (non-seawater) accounted for 27 percent.

### **INSTITUTIONAL AND OTHER USES**

The “institutional” and “other” use type categories were adopted by the District in 2014, and the quantities permitted to the categories are relatively small due to their limited allocation. The two categories are combined into one chapter of this report.

The institutional use category includes hospitals, schools, and other facilities that were historically categorized as industrial/commercial or public supply. Institutional uses averaged 2.9 mgd in 2022. The “other” uses averaged 1.2 mgd and were primarily for environmental augmentation to maintain levels in surface water bodies if they fall below trigger elevations defined by environmental management plans.

### **WATER USE CAUTION AREAS**

Water withdrawal quantities for the District’s three Water Use Caution Areas (WUCAs) and the Most Impacted Area (MIA) of the Southern Water Use Caution Area (SWUCA) are reported in Appendix B. The estimates below are based on regulated sources only and therefore exclude domestic self-supply.

*SWUCA:* A quantity of 601.2 mgd was withdrawn in the SWUCA, of which 487.5 mgd was from groundwater and 113.7 mgd was from surface water. The largest water use category in the SWUCA was agriculture at 267.6 mgd.

*MIA of the SWUCA:* A quantity of 101.5 mgd was withdrawn by WUPs in the MIA of the SWUCA, of which 56.1 mgd was from groundwater. Public supply was the largest category at 48.5 mgd, but 37.7 mgd of the public supply was from surface water sources.

*Northern Tampa Bay WUCA (NTB WUCA):* A quantity of 321.1 mgd was withdrawn in the NTB WUCA in 2022, of which 174.8 mgd was from groundwater. The largest use category in the NTB WUCA was public supply at 269.4 mgd, although more than half of the public supply was from surface water sources.

*Dover/Plant City WUCA (DPC WUCA):* A quantity of 55.9 mgd of water was withdrawn in the DPC WUCA, of which 96 percent was from groundwater. The largest use in the DPC WUCA was for agriculture at 26.9 mgd, flowed closely by public supply at 26.5 mgd. There were five frost/freeze nights within the DPC WUCA in 2022.

# **2022 ESTIMATED WATER USE REPORT**

## **INTRODUCTION**

The Estimated Water Use (EWU) Report is an annual summary of water withdrawals and use from natural resources in the Southwest Florida Water Management District (District). The District is one of five regional water management districts created by the Florida Legislature, with jurisdictional boundaries based primarily on watershed drainage basins. The District's mission is to protect water resources, minimize flood risks, and ensure the public's water needs are met. The EWU Report provides data for a variety of water supply planning and management purposes. The majority of the water use quantified in the EWU Report is based on metered withdrawals, as required under the District's water use permits (WUPs).

### **DISTRICT AND WUCA GEOGRAPHICAL BOUNDARIES**

The District covers all or part of 16 counties: Charlotte, Citrus, DeSoto, Hardee, Hernando, Highlands, Hillsborough, Lake, Levy, Marion, Manatee, Pasco, Pinellas, Polk, Sarasota, and Sumter. The EWU Report includes water use for the portion of each county that's within the District's boundary.

Figure 1 shows the District's boundaries, along with the boundaries of Water Use Caution Areas (WUCAs) defined within the District:

- Southern WUCA (SWUCA),
- Most Impacted Area (MIA) of the SWUCA,
- Northern Tampa Bay WUCA (NTB WUCA),
- Dover/Plant City WUCA (DPC WUCA).

The WUCAs are areas where recovery strategies are needed to address water resource impacts. Strategies include enhanced regulatory requirements, engineering projects, and other management tools. WUPs within the WUCAs have specific meter and pumpage reporting requirements. The region defined as the MIA is a special area within the SWUCA where permitting of new quantities that impact the Upper Floridan aquifer water level is currently suspended.

Portions of the SWUCA and the NTB WUCA were created in 1989 and 1991, respectively, because long-term withdrawals from the Upper Floridan aquifer contributed to sea water intrusion, reduced aquifer levels, and lowered water levels in lakes and wetlands, among other impacts. The

DPC WUCA was created in 2011 in response to intense short-term pumpage for crop freeze protection that caused intense drawdown in the Upper Floridan aquifer, triggered sinkholes, and damaged many domestic wells in the region. The DPC WUCA includes portions of the SWUCA and NTB WUCA but does not supersede them.

The EWU Report also quantifies water use for two Watershed Priority Areas of the Facilitating Agricultural Resource Management Systems (FARMS) Program. The FARMS Program is an agricultural cost-share reimbursement program that reduces groundwater withdrawals from the Upper Floridan aquifer through conservation and best management practices. Figure 2 shows the two FARMS Watershed Priority Areas.

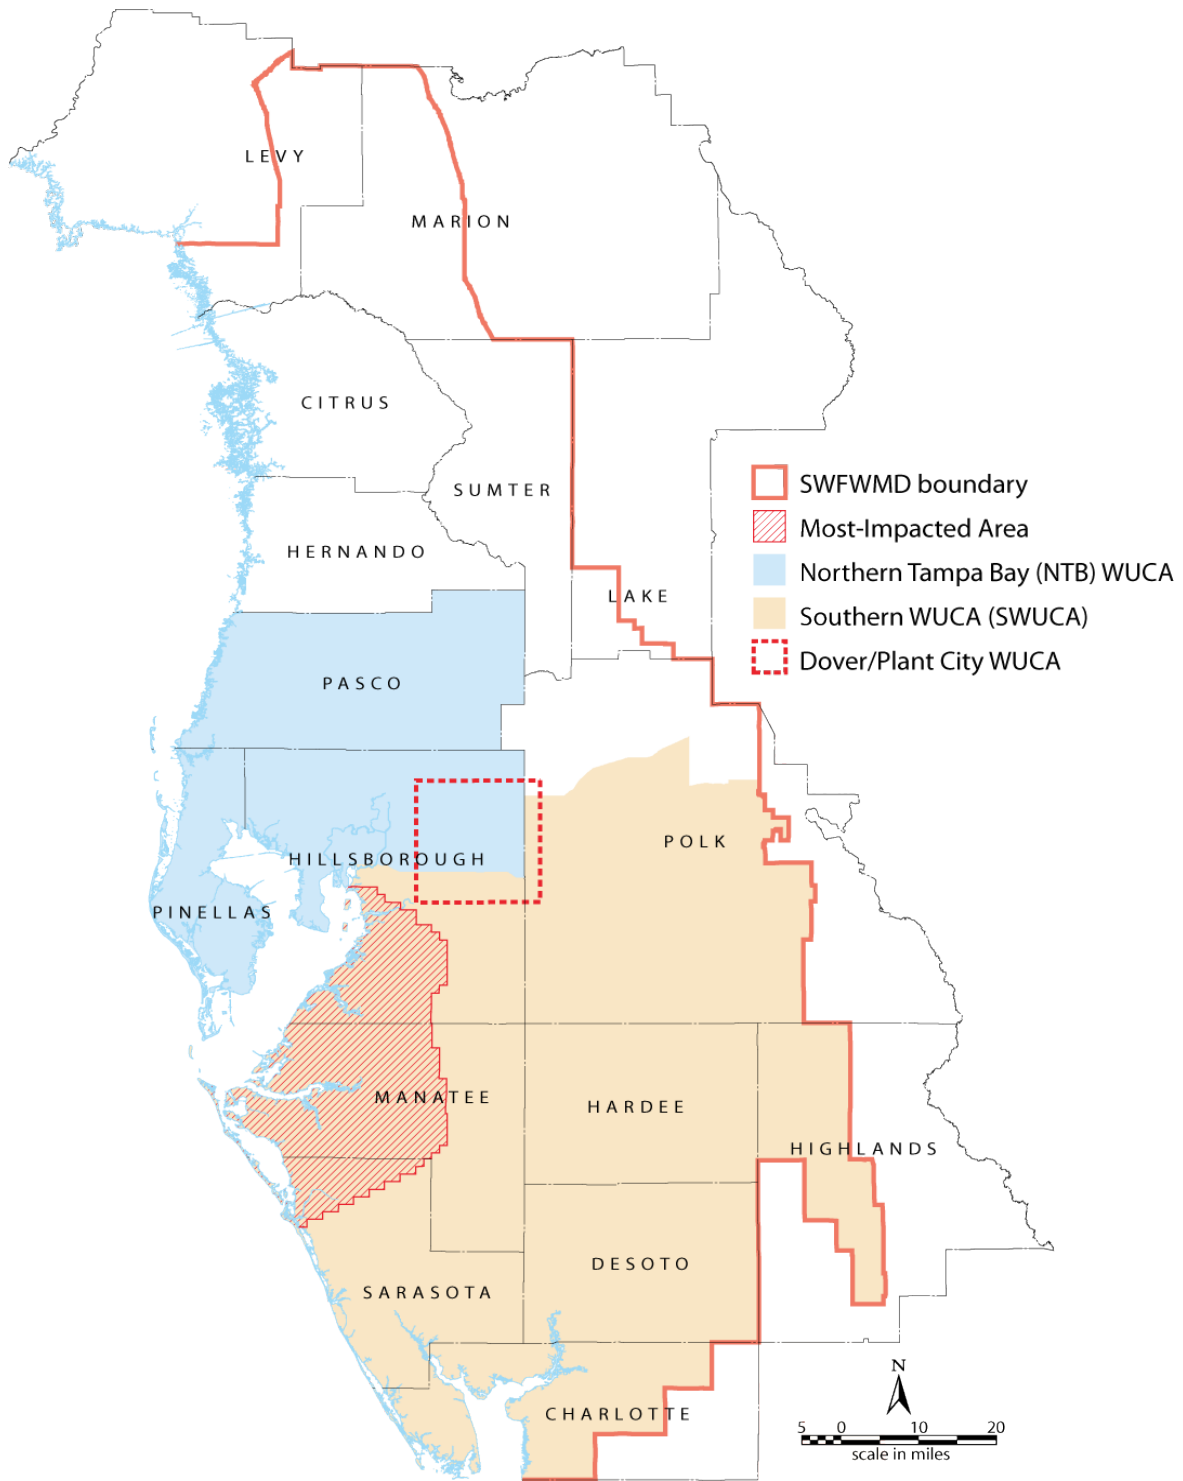

More information on each WUCA, their recovery strategies, and the FARMS Program is available at: <https://www.swfwmd.state.fl.us/projects>.

The Central Florida Water Initiative (CFWI) is a water supply planning area overlapping three water management districts in central Florida. It was established for collaborative planning efforts among the districts and other agencies. The District's portion of the CFWI planning area matches the political boundaries of Polk and Lake counties within the District. CFWI-specific totals are not included because data from the two counties can be easily combined if needed.

### **HISTORY OF DISTRICT EWU REPORTS**

The District has prepared Estimated Water Use (EWU) reports since 1982. Through 1986, the reports were a cooperative effort between the District and U.S. Geological Survey (USGS). Prior to 1992, the EWU reports relied on non-documented sources such as data from the Benchmark Farm Program for agricultural WUPs, voluntary survey responses for public supply, the Bureau of Economic and Business Research (BEBR) population information for domestic use, and reported meter data for both industrial and power generation use. Beginning in 1992, the EWU reports were based on metered water use data as a growing number of WUPs were required to report their metered withdrawals on a monthly basis. The water use methodology has been fairly consistent since the 1994 EWU Report, so 1994 is a recommended first year for historic/multi-year evaluations.

# 2022 ESTIMATED WATER USE REPORT

# 2022 ESTIMATED WATER USE REPORT

**Figure 2. FARMS Priority Watershed Areas of Upper Myakka River and Shell, Prairie, and Joshua Creeks**

## **2022 ESTIMATED WATER USE REPORT**

### **EWU REPORT DATA SOURCES**

The water use data was primarily derived from WUP-reported withdrawals in the District's Water Management Information System (WMIS) database. Most quantities are from empirical data: metered pumpage from groundwater wells or surface water intakes. The non-metered withdrawal points are estimated by ratio of the metered withdrawals per permitted quantity. Sets of estimation ratios are calculated by month, predominant use type, and by four tiers of well/intake sizes. The methodology is explained in more detail in Appendix F.

When the District first required metering, the permitting threshold was 500,000 gallons per day (gpd) annual average. In 2003, the metering threshold became 100,000 gpd for all WUPs located within a WUCA and all public supply WUPs Districtwide. Most non-public supply WUPs outside of any WUCAs (in the District's northern counties) still have a metering threshold of 500,000 gpd. Special metering may still be required for smaller WUPs if the withdrawals could potentially impact existing users or natural systems. Metering is required on all WUPs in the DPC WUCA that have freeze protection quantities or have crops that typically need freeze protection.

The ability to collect and keep accurate meter records on water use has been tremendously important to the District's mission of managing limited water resources. Doing so increases the likelihood that water is shared fairly and that withdrawals do not adversely impact existing legal users and environmental resources. The data is also valued for environmental, hydrogeologic, demographic, and other scientific evaluations. Most permittees responsibly submit meter records and reports as required under the terms of their WUPs.

### **WATER USE CATEGORIES**

The chapters of the EWU Report are sorted by seven broad "predominant use" categories:

- Public Supply
- Domestic Self-Supply
- Landscape/Recreation
- Agricultural
- Mining/Dewatering
- Industrial/Commercial
- Institutional & "Other"

Figure 3 shows the distribution of permitted wells within the District by the predominant use categories.

Institutional and "other" are separate categories but are combined in this report because their current uses are relatively small.

The District's permitting system has over 300 detailed water use codes to identify specific use types. Many large permittees have multiple use codes to define various uses, and some withdrawal points may have more than one use code. To prevent this report's tables from being overly complicated, detailed uses are grouped by general similarities. Specific use code definitions can be found in the footnotes of the Appendix A tables.

The domestic self-supply use category has no available metered data, as water use from small domestic wells is not regulated by the District. The estimates are calculated on a countywide basis. This category is excluded from some tables in this report that focus on withdrawals from regulated sources only.

### **AUGMENTATION AND REPUMPED WATER**

The EWU Report focuses on withdrawals from natural resources, but permittees may report pumpage for other reasons such as alternative supply imports or onsite transfers of blended water sources.

Withdrawals from natural resources that are sent to irrigation ponds are considered "augmentation pumpage" and are included as withdrawals in this report. Repumped quantities from irrigation ponds to their end use are excluded because they are not directly withdrawn from natural water resources. Repumped quantities may have been previously counted as augmentation and may have been blended with reclaimed water or captured stormwater. Agricultural crop irrigation estimates derived from this report should consider that permittees may have used repumped tailwater, stormwater, or reclaimed water that have reduced the amount of withdrawals from natural resources. Actual crop application rates may be greater than resource withdrawals in this report where alternative supplies, captured stormwater, and recirculated quantities were utilized.

## **2022 ESTIMATED WATER USE REPORT**

Reclaimed water use is not quantified in this report, except for some deductions calculated for per capita use. Reclaimed water inflows and use are available in other District reports at: <https://www.swfwmd.state.fl.us/projects/reclaimed-water>.

Captured stormwater is not regulated by the District and isn't metered by most users. In most cases, captured stormwater use isn't quantified in this report; however, a few public supply utilities use a significantly large amount of stormwater for irrigation and quantify its use.

### **MITIGATION WITHDRAWALS**

Environmental mitigation pumpage to augment surface water bodies is included in this report on a case-by-case basis. Sometimes withdrawals are excluded because a substantial portion of water percolates back through an unconfined aquifer to the withdrawal point, so the quantity recirculates. Mitigation pumpage is usually classified in the predominant use category that caused the impact. A growing number of mitigation withdrawals are being categorized in the "other" use type.

### **ALTERNATIVE WATER SUPPLY REQUIREMENTS**

The District may require a permittee to use reclaimed water or other alternative water supply in place of natural resources when the alternative supply is available, is feasible, and the water has the quality and reliability necessary for the use. If a WUP's primary source is an alternative supply, there may be a permitted "standby" well that can be pumped if the alternative supply is not available through no fault of the permittee. Some active WUPs may appear to have little or no water use because they were utilizing an alternative source.

### **CAVEATS FOR WATER USE ESTIMATIONS**

*Annual Average Units:* All quantities in this report are annual average daily units of "million gallons per day" (mgd) unless otherwise indicated.

*Small Wells:* A WUP is not required if the intended withdrawals are less than 100,000 gpd and the well is less than 6 inches in diameter, or the surface water withdrawal pipe is less than 4 inches in diameter. In the MIA of the SWUCA, a WUP is required when the cumulative outside diameter of the well is greater than 6 inches and the well was constructed after April 11, 1994.

*Domestic Self-supply Wells:* The common water source for rural households are privately owned wells typically 4 inches in diameter, which are small enough to be exempt from WUPs. Estimates for domestic self-supply use are based on U.S. Census parcel population outside of utility service areas, where it's assumed that a house not served by a utility has a well. The domestic self-supply estimates do not include shallow lawn irrigation wells at homes within public supply utility service areas.

*Meter Reporting Errors:* This report was compiled by analyzing approximately 304,000 monthly and daily pumpage/meter readings received from permittees. Some reporting errors are inevitable. Obvious errors such as misplaced decimals or uncorrected meter rollovers are fixed when found. Despite quality control efforts, some errors may occur within the realm of possibility or within use types that vary greatly by season. Errors found in historical pumpage data are fixed for this report and are forwarded to the District's regulatory staff. However, corrections to the WMIS database's historical records require written consent from the permittee that provided them, who may not be respondent. This may create discrepancies between the EWU Reports and other WMIS queries.

*Rounding Discrepancies:* For this report, raw numbers were calculated to the gallon at the extent viable, although many flow meters have hundred-gallon or thousand-gallon units. Despite the laws of mathematics, similar calculations of very large data fields can yield slightly different answers. Thus, some totals shown may be slightly different from manual calculations. Small discrepancies can occur within the tables due to rounding. For this reason, the mgd totals are presented to three decimal places in most tables and appendices to support calculations, but are given to only one decimal place in the text to express a more conservative level of accuracy.

### **"USE" VERSUS "WITHDRAWAL" TERMINOLOGY**

This report's sections on public supply and districtwide totals describe separate quantities for *withdrawals* and *use* in italics. For all predominant use categories except public supply, the water *use* is synonymous with water *withdrawal* because the water is typically used where and when it is withdrawn. For the public supply category, a utility's actual water *use* can be

## **2022 ESTIMATED WATER USE REPORT**

largely different from the amount *withdrawn* for several reasons:

- Imports and exports between utilities (including some outside of the District),
- Net quantities stored and released from off-stream surface water reservoirs or aquifer storage and recovery (ASR) systems can be different at the beginning and end of the year, sometimes by billions of gallons,
- Exports from large-scale regional water treatment facilities to multiple public utilities in different counties,
- Water treatment losses, including brackish desalination systems,
- Transmission system losses.

The public supply *use* data comes from Public Supply Annual Reports (PSARs) received from utilities by April of the following year.

### **SNAPSHOTS IN TIME**

The WMIS database is dynamic; it is updated daily as WUPs are issued, modified, and expire. The cumulative changes are relatively stable, but specific values can fluctuate. This report relies on “snapshots” of permit and pumpage data that are taken on separate dates.

*Permit Data:* A snapshot of 2022 permit data was taken on December 31st, 2022, to save the end-of-year attributes. The permit snapshot includes:

- The status and permit quantity of each WUP,
- Each withdrawal point’s status, location, and permitted quantity apportioned from the WUP’s total permit quantity,
- The water use-type codes and quantity allocations as assigned to the WUP and to specific withdrawal points,
- Several alpha-numeric codes applied to the permit and withdrawal points that describe various attributes and regulatory conditions.

*Pumpage Data:* Pumpage snapshots for the EWU Report are queried later in the year. Permittees have a few weeks after the new year to upload their December pumpage. The permit snapshot data is reviewed before the pumpage snapshot because it defines which withdrawal points were valid and should have their pumpage data included. Pumpage queries taken a few months later allow time for tardy submissions and for meter/pumpage errors to be identified and corrected by regulatory staff, with

communication from the permittee. The final 2022 pumpage snapshot for this report was taken on October 26, 2022.

### **APPENDICES**

Six appendices are provided in this report.

*Appendix A*, Tables A-1 through A-3 show public supply withdrawals, imports & exports, population served, and other data summarized from the PSARs. Additional tables for other water use categories list all metered WUPs, their average withdrawal, and the permit total and portion for the use category. Appendix A also includes tables of monthly average withdrawals for each water use category by county.

*Appendix B* shows the annual average withdrawals split by surface water only and groundwater only, from regulated water resources within the District. Separate tables are provided for Districtwide, within the three WUCAs and the MIA, and within the FARMS Priority Watersheds.

*Appendix C* identifies the total permitted quantities from surface water and groundwater by county for the District, the three WUCAs and the MIA. Appendix C also contains freeze protection quantities permitted for agricultural use in the DPC WUCA.

*Appendix D* contains ten years of historic per capita water use for the public supply permittees that submit PSARs. Two tables are provided, one for unadjusted gross per capita (Table D-1) and one for compliance per capita (Table D-2).

*Appendix E* contains the Uniform Per Capita Report prepared for the Florida Department of Environmental Protection (FDEP). The report provides utility gross and residential per capita estimates that follow statewide consistency guidelines universally accepted by the FDEP and the five Water Management Districts in 2008. The estimates are based on persons per household data, which allows for a consistent methodology for all utilities in Florida, but may not be as accurate as information provided in Appendix A.

*Appendix F* is a methodology narrative that explains how the data from the WMIS database, PSARs, and other sources is analyzed and processed to create the EWU reports. It also describes historical improvements to the methods.

## 2022 ESTIMATED WATER USE REPORT

### **PUBLIC SUPPLY**

**WITHDRAWALS = 601.7 MGD**

**USE = 578.4 MGD**

In 2022 the average withdrawals in the District for public supply totaled 601.7 mgd. This total includes 355.8 mgd of groundwater, 237.9 mgd of surface water, and 8.0 mgd of desalinated seawater. The withdrawals increased from 599.4 mgd in 2021 and are above a ten-year average of 557.5 mgd.

The location and quantity of water “used” for public supply by customers can vary from quantities “withdrawn” from water resources due to imports and exports between utilities; treatment, storage, and distribution system losses; and net changes from storage systems over the year to improve supply reliability. After accounting for imports, exports, storage, and losses from treatment and distribution, the gross public supply water use was 570.3 mgd.

#### **GENERAL INFORMATION**

The public supply water use category is for water quantities distributed by public and private water utilities. Public supply is defined by District Rule as a community water system that serves at least 15 service connections used by year-round residents or that serves at least 25 individual year-round residents. Large utilities may have some specific uses that aren’t directly related to population such as fire suppression, common area landscape irrigation, and water supplied to businesses. The public supply category may also be a minor subcategory allocation for permittees that are not connected to a utility but provide water for housing or personal/sanitary use to employees, visitors, farmworkers, etc.

#### **DATA SOURCES**

There are three sources of data for the public supply water use category: the PSARs provided by large water utilities, metered withdrawals from the WMIS database for other permittees with a public supply use allocation, and District-estimated withdrawals for small public supply WUPs with permit allocations less than 100,000 gpd. In 2022, the District had 331 active WUPs that included public supply withdrawals. There were 130 WUPs with PSAR reporting conditions. Eleven of the PSAR utilities were “wholesale”

utilities that have no local withdrawals but provide a PSAR because they import more than 100,000 gpd from a regional water authority or neighboring utility.

The PSARs provide detailed annual water use and other demographic information. Select PSAR data for each utility is provided in Appendix A, Tables A-1 through A-3.

- Table A-1, Part 1 shows the water withdrawn from resources, import/exports, treatment losses, gross use, functional population served, and per capita use calculations.
- Table A-1, Part 2 lists the withdrawals and permit quantities of the remaining metered public supply WUPs that aren’t required to submit PSARs.
- Table A-2 shows the PSAR utility-reported specific uses for water delivered including residential use; industrial/commercial, landscape/recreation, and golf course customers served by utilities; firefighting and other municipal uses; and water losses from distribution systems.
- Table A-3 lists the PSAR utility-reported water transfers from water supply authorities and neighboring utilities.

There were 11 community utilities whose PSAR-reported withdrawals included golf course irrigation or industrial uses that are represented within other categories of this report. To avoid double-counting, those quantities are excluded from Table 1. Details are footnoted on the table.

There were 162 small, unmetered public supply permittees with estimated withdrawals totaling 4.0 mgd, mostly for residential use.

There were 47 metered WUPs outside the PSAR group that withdrew 194.0 mgd for public supply. This amount includes Tampa Bay Water’s withdrawals that are exported to utilities. Other metered WUPs include farms and institutions with personal sanitary use allocations, small golf communities, environmental augmentation permits, and small utilities with a special metering condition because the withdrawals are near environmentally sensitive areas.

## **2022 ESTIMATED WATER USE REPORT**

### **GROSS WATER USE QUANTITIES**

The gross water use total of 578.4 mgd was 96 percent of the withdrawal total. The 10-year average percentage of public supply water used/withdrawn is 96 percent districtwide.

The ratio of water used/withdrawn can vary immensely by county due to its transmission from regional water sources to utilities in neighboring counties. For example, Pinellas County imported two thirds of its public supply from neighboring counties. Figure 3 has separate pie charts of the county water withdrawals and water use for public supply.

### **GROUNDWATER, SURFACE WATER, & SEA WATER**

In 2022, groundwater provided 59 percent of public supply water withdrawals in the District. Though not quantified for this report, it's assumed that approximately 90 percent of groundwater withdrawals were from the Upper Floridan aquifer. The surficial aquifer and the Hawthorne aquifer system are also utilized for public supply.

The District's largest groundwater WUP is Tampa Bay Water's Consolidated Wellfield (WUP #11771). The WUP has a 90 mgd annual average permitted quantity that can be rotated among 11 regional wellfields across three counties in the Tampa Bay area. The withdrawal rotation allows for resting and recovery of water resources in accordance with environmental management plans. In 2022, the annual average water withdrawn from the Consolidated Wellfield WUP was 76.7 mgd, with 43.1 mgd from wells in Pasco, 20.7 mgd from Hillsborough, and 13.0 mgd from Pinellas. The withdrawals are divided by county for this report.

Surface water accounted for 40 percent of public supply water withdrawals in 2022. Most surface water withdrawals for public supply occur at large-scale water treatment facilities located in Hillsborough, DeSoto, and Manatee Counties. The Villages community in Sumter County utilized approximately 10.1 mgd of stormwater captured in lined ponds for outdoor public supply use. The Villages' stormwater use is included as surface water in Table 1 because it was metered and factored into their PSAR calculations.

Tampa Bay Water withdraws surface water from the Alafia River and Tampa Bypass Canal system, which has gates and transfer pumping systems

with the Hillsborough River. The water is stored for seasonal and drought-year reliability in the C.W. Bill Young Reservoir and is exported to utilities in Hillsborough, Pasco, and Pinellas counties. The reservoir has a capacity of 15.5 billion gallons. The reservoir held 14.9 billion gallons at the beginning of January 2022 and held 15.3 billion gallons at the end of the year; the net gain averages 1.1 mgd over the year.

Tampa Bay Water's seawater desalination facility near Apollo Beach treats saltwater withdrawn from Tampa Bay and blends the water into its regional system. The facility provided potable water over 210 days at rates ranging from 2 to 16 mgd, which equated to an annual average production of 8.0 mgd in 2022. Within this report, the treated seawater effluent is included in public supply totals but excluded from tables specific to surface water or groundwater. Seawater withdrawals are not regulated by the District.

The Peace River Manasota Regional Water Supply Authority (PRMRWSA) withdraws and stores water in DeSoto County and distributes potable water to the county utility departments of Charlotte, DeSoto, Sarasota, and the City of North Port. Manatee County is also a member of the PRMRWSA but is not currently a water customer. The Peace River facility's WUP allows for surface water withdrawals to 80 mgd annually or 258 mgd max day, but within environmental minimum river flow levels. The facility has two off-stream reservoirs with a combined capacity of 6.9 billion gallons and 21 ASR wells with a combined storage capacity of 6.3 billion gallons.

There are five other utility-operated surface water treatment facilities in the District, each utilizing an in-stream reservoir for storage, so withdrawals are taken on demand. The City of Tampa has operated the Hillsborough River Reservoir since the 1920s. The City of North Port acquires approximately half of its supply from a surface water facility on the Myakkahatchee Creek. Manatee County and the City of Bradenton have in-stream reservoirs known as Lake Manatee and Evers Lake. The City of Punta Gorda in Charlotte County operates the Shell Creek water treatment facility. The permitted quantities and

## **2022 ESTIMATED WATER USE REPORT**

withdrawals at these facilities are listed in Appendix A.

### **PER CAPITA WATER USE MEASURES**

The “per capita” measurement is a widely used ratio of public supply water use/population. Multiple types of per capita calculations are provided in the appendices and are defined below.

- Unadjusted gross, in Table A-1
- Adjusted gross, in Table A-1
- Compliance, in Table A-1
- Residential, in Table A-2
- DEP “uniform” gross and residential per capitas, in Tables E-1 and E-2.

*UNADJUSTED GROSS PER CAPITA:* The unadjusted gross per capita (UGPC) is simply the utility’s gross water use divided by the functional population served. In 2022, the Districtwide UGPC was 100 gpcd. A ten-year history of each utility’s UGPC is provided in Appendix D.

Some utilities may have high UGPC rates for various reasons, such as they may serve commercial customers unrelated to population. A high UGPC is also common in small master-metered communities where residents lack an economic incentive to conserve water. Suburban neighborhoods with large lot sizes tend to have more lawn irrigation per person. New developments may have initially high UGPCs as new landscaping is established. Retirement communities with below-average persons per dwelling may also show a high UGPC.

Low UGPC rates are common in communities with high water prices. Utilities that calculate their population by dwelling unit may have perceived low UGPC rates due to over-estimating the population by assuming year-round residency at seasonal or rental lodgings.

*ADJUSTED GROSS PER CAPITA:* The adjusted gross per capita (AGPC) allows for a more equitable comparison of utilities by deducting specific water uses that are unrelated to population. Utilities may deduct water quantities on their PSARs for “significant uses” including industrial/commercial customers, golf courses, and environmental mitigation before dividing by

the population. To qualify as a significant use, the amount delivered by the utility must meet certain criteria and be properly documented. In 2022, the Districtwide average AGPC was 99 gpcd.

The golf course deduction is available to utilities that serve golf courses and mixed-use resorts. Most golf courses within the District have their own WUPs with dedicated irrigation wells, but there’s a few golf courses in urban areas that irrigate with fresh water supplied by a utility.

The environmental mitigation deduction can be taken for augmentation quantities if a permittee was required to replenish any lakes or wetlands that were impacted by their withdrawals. No utilities used this deduction in 2022, but it’s an option for drier years.

*COMPLIANCE PER CAPITA:* The compliance per capita (CPC) includes the AGPC deductions plus two additional credits for stormwater use and reclaimed water exports. The CPC was implemented for calculating compliance with a Districtwide conservation rule set in 2009 with a goal of attaining 150 gpcd for all public supply permittees, based on a five-year average. In 2022, the Districtwide average CPC was 94 gpcd, and eight utilities were above 150 gpcd. A ten-year history and five-year average of each utility’s CPC is provided in Appendix D.

The stormwater use deductions for the CPC must be from metered use in order to be credited. The quantities must be used within the utility’s service area, and the deduction can’t exceed the WUP allocation or actual withdrawals. Stormwater deductions also exclude golf course uses to avoid double-counting with the golf course deduction.

The reclaimed water deduction is a special credit for reclaimed water that was exported to customers outside of the utility’s service area. Reclaimed water used within the utility’s own service area isn’t applicable because it already offsets a share of their resource withdrawals.

*RESIDENTIAL PER CAPITA:* The residential per capita (RPC) rate is a useful statistic for analyzing home water use only. The RPC represents water used only at single-family, multi-family, and mobile home residences according to the utility’s billing detail. The RPC is not used for regulatory purposes, so formal documentation is not

## **2022 ESTIMATED WATER USE REPORT**

necessary. The Districtwide average RPC rate was 70 gpcd in 2022. Countywide RPC values are used as multipliers to estimate the domestic self-supply use in each county, as discussed in the next chapter.

*DEP UNIFORM GROSS & RESIDENTIAL PER CAPITA:* In 2009, the DEP developed a uniform statewide methodology for the five water management districts to calculate public supply per capita water use and report it to the DEP for statewide analyses. The method is not otherwise utilized by the District for regulatory or planning purposes.

The DEP uniform method provides both gross and residential per capita values. The residential population is calculated using the number of housing units and the average persons per household within the utility service area. The data is sent to the DEP annually and is provided in Appendix E. For 2022, the Districtwide DEP uniform gross per capita was 103 gpcd, and the DEP uniform residential per capita was 72 gpcd.

### **PUBLIC SUPPLY WATER TRANSFERS**

Substantial quantities of potable water are transferred from counties where alternative water sources are located to neighboring counties with high demand. Regional alternative water supply projects reduce stress on groundwater resources and wetland environments and improve reliability for emergencies and drought conditions. Table A-3 in Appendix A provides the reported public supply imports and exports by regional water supply authorities and utilities. Approximately 253 mgd was transferred within the District in 2022.

### **MONTHLY WATER WITHDRAWALS AND RAINFALL**

The monthly average rainfall in the District is compared to monthly public supply surface water and groundwater withdrawals in Figure 5. Surface water withdrawals increase during the rainy season for storage in reservoirs and ASR systems to provide year-round reliability.

Districtwide annual average rainfall in 2022 was 56.5 inches, which was above the historic mean average of 52.9 inches. Many months were below average, but September 2022 had a record-high rainfall of 14.6 inches due to Hurricane Ian making landfall by Fort Myers and crossing northeast across the state.

The monthly withdrawal data for Figure 5 is provided in Appendix A, Table A-4. The monthly data excludes seawater desalination and stormwater use.

### **PUBLIC SUPPLY IN WATER USE CAUTION AREAS**

A substantial amount of surface water is used as alternative water supplies in the WUCAs. WUCA-specific withdrawal quantities for groundwater and surface water are provided in Appendix B.

In the SWUCA, 235.1 mgd of water was withdrawn for public supply, of which 148.9 mgd was from groundwater and 86.2 was from surface water (Table B-2).

In the MIA within the SWUCA, 48.5 mgd of water was withdrawn for public supply, of which 10.7 mgd was from groundwater and 37.7 mgd was from surface water (Table B-3).

In the NTB WUCA, 269.4 mgd was withdrawn for public supply, of which 127.8 mgd was from groundwater and 141.6 mgd was from surface water (Table B-4).

In the DPC WUCA, 26.5 mgd was withdrawn from groundwater for public supply, nearly all from groundwater (Table B-5).

### **PUBLIC SUPPLY PERMITTED QUANTITIES**

The end-of-year permitted quantities allocated by the District for public supply were 841.0 mgd annual average, of which 506.2 mgd were permitted for groundwater sources. The permitted quantities by source, county, use type, and WUCA are provided in Appendix C.

It should be noted that in Appendix C, Tables C-1 and C-4, the permit allocation for Tampa Bay Water's Consolidated Wellfield WUP (90 mgd, annual average) is assigned solely to Hillsborough County, although some of the wells are located in Pasco and Pinellas counties. This permit allows for rotational use for environmental management and does not divide the allocated quantities by well or by county. As previously mentioned, the actual withdrawals under this WUP are allocated among the three counties where they occurred. Any comparisons of "permitted" quantities to "withdrawal" quantities for these three counties could be affected by this difference.

Data Sources: 2022 Public Supply Annual Reports & Estimated Water Use Tables derived from the WMIS database.

Calculations from raw data create minor rounding discrepancies in totals.

- \* Data is only for the portion of the county within the District.
- 1 Generally, Gross Use = Withdrawal + Imports – Exports – Treatment losses. Discrepancies can occur from seasonal storage, transmission losses, and other reasons footnoted.
- 2 Quantities metered by public supply permittees that were not required to submit PSARs.
- 3 Estimated for non-metered Small General water use permits (less than 100,000 gpd on an annual average basis).
- 4 The total Public Supply withdrawals = PSAR metered withdrawals + non-PSAR metered withdrawals + estimated public supply withdrawals. Adjusted for Tampa Bay Water.
- 5 The total Public Supply use = PSAR gross use + non-PSAR metered withdrawals + estimated public supply withdrawals.
- 6 The countywide PSAR metered withdrawal contains some deductions from totals in Appendix A, Table A-1 to prevent double-counting quantities on mixed-use WUPs that are included in the landscape/recreation or industrial/commercial categories: -0.021 mgd Citrus, -0.648 mgd Polk, -0.158 mgd Sarasota, and -0.798 mgd Sumter counties.
- 7 Hillsborough County Non-PSAR Metered includes 8.03 mgd of Tampa Bay Water’s seawater desalination. The seawater quantity is not included in the specific surface water or groundwater withdrawals.
- 8 The countywide PSAR metered withdrawal was adjusted from totals shown in Appendix A, Table-A to correct for "water year" (Oct-Sept) data reported by the City of Tampa WUP 2062 (-0.501 mgd) and by City of Lakeland WUP 4912 (0.100 mgd).
- 9 The City of Tarpon Springs is in Pinellas County but has three of its 26 supply wells in Pasco County. The Pasco wells withdrew 0.690 mgd. An adjustment is included the table.
- 10 The total PSAR withdrawal for Sumter County includes 10.117 mgd of stormwater captured, metered, and beneficially used by The Villages.

# 2022 ESTIMATED WATER USE REPORT

## Percent of Public Supply Withdrawals By County

**Total Withdrawals = 601.7 mgd** (PSAR, non-PSAR metered, and estimated)  
 Calculation includes only District portion of counties.

## Percent of Public Supply Use By County

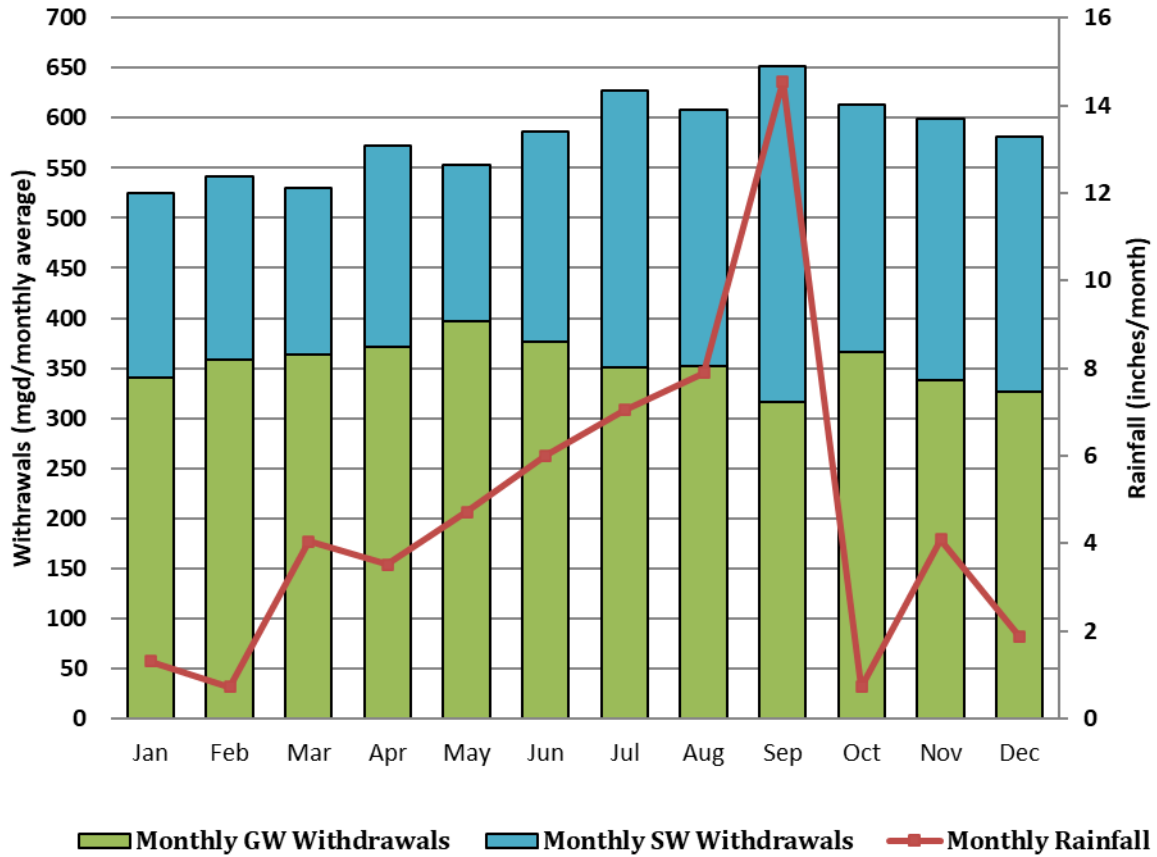

**Total Use = 578.4 mgd** (Table 1, Gross Water Use)  
 Calculation includes only District portion of counties.

 (Data Sources: Appendix A, Table A-4 and District rainfall data)

## **2022 ESTIMATED WATER USE REPORT**

### **DOMESTIC SELF-SUPPLY WITHDRAWAL/USE = 39.3 MGD**

An estimated 39.3 mgd of water was used for domestic self-supply within the District in 2022. This estimate is an increase from 38.1 mgd in 2021.

#### **GENERAL INFORMATION**

The domestic self-supply category includes potable water withdrawn from privately owned wells, typically at rural family residences for both indoor and outdoor needs. The water users are located outside of the distribution systems of public supply utilities.

Domestic supply wells are typically four inches in diameter and are exempt from regulation by the water management districts. Studies of average domestic use have been limited, but some research suggests that rural water use can vary significantly upon the residence. Many rural homes do not irrigate their lawns, so their water use is primarily indoors and may be below average. However, some rural homes may use over twice as much water for outdoor uses like landscaping, gardening, equestrian uses, etc.

It is assumed that groundwater is the sole source of water for domestic self-supply because surface water treatment by private residences for potable uses is uncommon. Most self-supplied residences also use septic systems, so most of the indoor water use is recharged on-site to the local unconfined aquifers.

#### **METHODOLOGY**

Unlike the other use categories, there is no metered use component available for domestic self-supply. The water use is estimated by multiplying the self-supplied population in each county by the average residential per capita water use in that county. One exception is Lake County, where the Districtwide per capita value is used instead of a countywide value because

there are no representative public supply WUPs in the District portion of Lake County.

Since 2014, the self-supplied population has been determined through a GIS-based analysis of U.S. Census parcel-level populations outside of all public supply utility service areas within the District. The domestic self-supplied population is recalculated each year. The GIS methodology is described in Appendix F.

The countywide residential per capita values are sourced from Appendix A, Table A-2. Factoring in the residential per capitassumes that the self-supplied population had similar water use habits as the residents served by the public supply systems within the same county. This includes weather influences on outdoor water use habits during the year.

Table 2 shows the self-supply population, each county's average residential per capita, and the calculated domestic self-supply use estimate. Figure 5 is a pie graph showing the percentage of the estimated self-supply used in each county. Monthly water use is not calculated for domestic self-supply, but it can be assumed that monthly use trends would be similar to the public supply trends.

#### **ADDITIONAL IRRIGATION USE**

Some public supply utility customers may have small private wells used only for lawn irrigation. These wells are typically small enough to be exempt from regulation by the water management districts. This "additional irrigation" use within public supply service areas is not factored into the domestic self-supply estimates nor other categories of the EWU Report. If needed, 5-year average planning-level estimates of additional irrigation use are available in the District's Regional Water Supply Plan, Appendix 3-3, Table 23, Residential Irrigation Well Data.

<https://www.swfwmd.state.fl.us/resources/plans-reports/rwsp>

## 2022 ESTIMATED WATER USE REPORT

**Table 2. Summary of Domestic Self-Supply Water Use by County, 2022**

County	GIS-Based Calculated Self-Supply Population <sup>1</sup>	Average Residential Per Capita Use <sup>2</sup> (gpd/person)	Estimated Domestic Self-Supply Water Use <sup>3</sup> (mgd)
*Charlotte	7,193	67	0.482
Citrus	50,044	83	4.154

Sumter	16,558	142	2.351
<b>District Total</b>	<b>521,833</b>		<b>39.297</b>

Data sources: District GIS data and Appendix A.

\* Data is only for the portion of the county within the District.

<sup>1</sup> The self-supply population is an annually calculated GIS query of census data point locations outside of active utility service areas. Population values include Permanent/Seasonal, Tourist, and Net Commuter populations.

<sup>2</sup> "Residential Per Capita," is from Table A-2 in Appendix A and is based on PSAR-reported residential water use submitted by utilities.

<sup>3</sup> Estimated Domestic Self-Supply Water Use = ("Self-Supply Population" x "Residential Per Capita") / 1,000,000

<sup>4</sup> The Districtwide residential per capita value of 70 gpcd was used as the multiplier for Lake County because there were no Public Supply permittees in the District portion of Lake County.

# 2022 ESTIMATED WATER USE REPORT

## Percent of District Domestic Self Supply Use By County

**Total Use = 39.3 mgd**

Calculation includes only District portion of counties

**Figure 6. Percentage of Estimated Domestic Self-Supply Water Use by County, 2022**

(Data source: Table 2)

## 2022 ESTIMATED WATER USE REPORT

### **LANDSCAPE/RECREATION**

**WITHDRAWAL/USE = 57.8 MGD**

Landscape/recreation water withdrawals were 57.8 mgd within the District in 2022. This quantity is slightly below 58.0 mgd in 2021. The ten-year average is 57.1 mgd.

#### **GENERAL INFORMATION**

The landscape/recreation use category is mostly for dedicated irrigation WUPs for golf courses, large landscapes, botanical gardens, cemeteries, parks, sports playing fields, and municipal common areas. A small fraction is for non-irrigation uses including public restrooms and facilities, aesthetic water fountains, and water-based recreation.

The quantified water uses in this report are only for withdrawals from natural resources and do not include reclaimed water or other alternative water supplies. Facilities that use reclaimed water for irrigation typically blend their supplies in storage ponds. Groundwater used to augment storage pond water levels is quantified, but blended quantities repumped from augmented ponds for irrigation is not to avoid double-counting.

Permittees that have access to alternative water supplies are required to utilize all of the alternative supplies first, so use from natural resources declines when alternative supplies are abundant. More than half the golf courses within the District use reclaimed water. Additional information on reclaimed water within the District is available at:

<https://www.swfwmd.state.fl.us/projects/reclaimed-water>.

*Multi-Use WUPs:* Approximately 12 percent of the WUPs with a landscape/recreation allocation also had permit allocations in another predominant use category. When the majority of the permitted use is for landscape/recreation, the WUP's primary use type is listed as such even if the permittee's business practice may fit another category. All multi-use WUPs have their withdrawals fractioned into their predominant uses for this report's allocations.

*Irrigation Permitting:* A WUP's allowable irrigation quantity is determined in part using an

irrigation rate calculation model known as AGMOD. This model is used to derive acre-inch irrigation rates for golf courses, lawn and landscapes, parks, cemeteries, and sports fields based on Florida-modified Blaney-Criddle calculations. AGMOD uses site-specific data for soil type, irrigation method, amount of solar radiation received, historic rainfall for the county, plant root depth, and other factors that affect how much supplemental irrigation will be required. The AGMOD program is available at: <https://www.swfwmd.state.fl.us/business/epermittin g/agmod-windows>.

*Golf Courses:* Golf course irrigation quantities are permitted based on the actual measured acreage of tees, greens, and fairways. A standard 50 inches per acre per year is permitted for tees and greens due to heavy foot traffic and very short cut height. The fairways receive supplemental irrigation quantities based on AGMOD calculations. No irrigation quantity is given for golf course roughs. Roughs are generally described as areas outside the main playing field, or at the third turfgrass cut height. Golf course permittees may irrigate the roughs with any water left over from the amount permitted for the playing areas. These rules apply to both water from natural resources and alternative water supplies unless disposal of excess reclaimed water is needed.

#### **2022 DATA**

Table 3 provides the landscape/recreation water withdrawal data by county and for specific use groups within the category. Most of the landscape/recreation withdrawals were for irrigation purposes, which are divided into three groups:

- Golf course play areas used 27.2 mgd, which was 47 percent of this category.
- Lawn and landscape irrigation use was 23.3 mgd, or 40 percent of the category, and may include the non-playing areas at golf resorts.
- An additional 3.5 mgd was used for other permitted irrigation uses including community common areas, sports fields, cemeteries, parks and playgrounds, and botanical gardens.

The augmentation group (3.0 mgd) is for water used to maintain surface water body levels for

## **2022 ESTIMATED WATER USE REPORT**

either aesthetic purposes or environmental mitigation related to landscape/recreation withdrawals. Animals & aquariums (0.4 mgd) includes water for maintaining aquatic habitats and water for animals at recreational facilities. Water parks & recreation (0.1 mgd) includes water for swimming pools, flume rides, mud courses, and other water-based recreation. Other non-irrigation uses are grouped as “commercial, restrooms, sanitary, other uses” (0.3 mgd) and may include recreation-related uses such as public drinking fountains, air conditioners, cleaning and maintenance, decorative water features, firefighting, personal/sanitary use, office facilities, food preparation, etc.

Figure 7 shows the percentage of use for each county.

### **GROUNDWATER & SURFACE WATER**

In 2022, groundwater provided 88 percent (50.6 mgd) of the landscape/recreation supply withdrawn in the District. Surface water use was 7.3 mgd. The surface water quantity reflects only withdrawals from natural resources; water from constructed irrigation ponds that are augmented by other sources are excluded.

### **MONTHLY WITHDRAWALS**

Figure 8 graphs the monthly average surface and groundwater use in comparison to regional rainfall. The graph demonstrates an inverse relationship between groundwater use and rainfall. Districtwide annual average rainfall in 2022 was 56.5 inches, which was above the

historic mean average of 52.9 inches. Several months were below average, but September 2022 had a record-high rainfall of 14.6 inches when Hurricane Ian made landfall by Fort Myers and crossed northeast across the state. The graph shows increased surface water use in October, when surface water flows/levels were high.

### **APPENDICES**

Appendix A, Table A-5 provides permit-specific water use data for each metered WUP in this category. The table shows the WUP number, permittee name, prominent water use code, withdrawal source (groundwater or surface water), annual average withdrawals, total WUP permitted quantities, and how much of the permitted quantity is specifically for landscape/recreation use.

Table A-6 in Appendix A gives the total monthly landscape/recreation water withdrawals per county. This is the data source for Figure 7.

Appendix B provides the specific groundwater and surface water use average quantities for each county and WUCA. In the SWUCA, the landscape/irrigation water use totaled 34.8 mgd.

Appendix C provides the permitted annual average quantities per use category, by water source, for the District and each WUCA. The District total permitted annual average quantities for landscape/recreation use at the end of 2022 was 125.0 mgd. Approximately 46 percent of the quantities permitted Districtwide for landscape/recreation supply were utilized.

(Data Source: Appendix A, Table A-6 and District rainfall data)

## **2022 ESTIMATED WATER USE REPORT**

### **AGRICULTURE**

**WITHDRAWAL/USE = 329.2 MGD**

In 2022, the total agriculture water withdrawals in the District were 329.2 mgd, which was an increase from 322.8 mgd withdrawn in 2021, but below a 10-year average of 342.2 mgd. The agriculture use type category is for water withdrawals from natural resources related to agricultural activities including irrigation, bed preparation, crop establishment, fertigation, chemigation, product washing and packing, freeze protection, irrigation system maintenance, livestock water needs, and personal sanitary use on farms.

#### **GENERAL INFORMATION**

Metering of agricultural water use is required for withdrawal points within WUCAs on WUPs issued for 100,000 gpd or more on an annual average basis. Since 10 of the District's 16 counties are located in WUCAs, the majority of agricultural WUPs fit this criterion. Additionally, in the SWUCA, all irrigation permits for 100,000 gpd or more on a "drought" annual average basis (2-in-10 statistical rainfall year) have metering requirements. In the District's northern counties, which are outside of the WUCAs, metering requirements are based on an original permitting standard of 500,000 gpd or more annual average. Therefore, fewer agricultural WUPs in the northern counties are metered. The metered withdrawal data, along with user-provided details on acreages and crops, has given the District excellent data on water resources used for irrigation of many crop types under varying climate conditions.

The establishment of the DPC WUCA in 2011 required metering for all agricultural withdrawals permitted with freeze protection quantities in the WUCA, as well as all crops that typically require freeze protection. Since farmers dealing with freeze events are primarily concerned with saving their crops and may be too busy to log meters, the District provides free automatic meter reading (AMR) service to accurately monitor freeze protection pumpage.

The AGMOD irrigation rate calculator is used to derive the acre-inch application rate for 39 crop

types based on Florida-modified Blaney-Criddle calculations. These calculations factor the crop type, growing season, geographic location, rainfall, soil type, irrigation method, solar radiation, and root depth. Additional information on agricultural permit quantity calculations can be found in Chapters 3 and 5 of the Water Use Permit Information Manual, Part B, Basis of Review, which is available at:

<https://www.swfwmd.state.fl.us/media/document/3166>

#### **2022 DATA**

Year-to-year fluctuations of agricultural water use are common and are often more pronounced than with other predominant use types. There are multiple factors for the annual variability. Record lows for Districtwide agricultural water use were set in 2020 when the Covid pandemic reduced agricultural activity, and in years 2015 and 2005 when there was excessive tropical rainfall. High water use has occurred in years of low effective rainfall and freeze protection events. Citrus disease has also impacted water use. Some of these topics are discussed below.

*Effective Rainfall:* Districtwide annual average rainfall in 2022 was 56.5 inches, which was above the historic mean average of 52.9 inches. Several months were below average, particularly in the spring growing season. However, September had a record-high rainfall of 14.6 inches when Hurricane Ian made landfall by Fort Myers and crossed northeast across the state. Such punctuated rainfall events are not as "effective" for irrigation as frequent daily rain. The Figure 10 graph shows reduced agricultural water use in the wetter months of June through September.

*Freeze Protection:* Frost/freeze events typically last for a few hours or days, but the short-term water use for crop protection can significantly influence the annual average totals. Pumping for freeze protection of strawberries, citrus, blueberries, nurseries, and aquaculture can remove over 800 mgd from the aquifer during a single freeze event. An 11-day freeze in 2010 caused an intense but temporary aquifer drawdown in the Dover/Plant City area that impacted approximately 750 wells, exacerbated approximately 140 sinkholes, and caused an estimated \$8 million in damages. The freeze led

## **2022 ESTIMATED WATER USE REPORT**

to the establishment of the DPC WUCA Recovery Strategy, and many measures to improve freeze protection while conserving water have been enacted since. The recovery strategy was removed in 2022, but metering and protective measures are still in place. In 2022, the DPC WUCA had five frost/freeze nights (below 35 degrees F.) on January the 23<sup>rd</sup>, 29<sup>th</sup>, 30<sup>th</sup>, and December 24<sup>th</sup> and 25<sup>th</sup>. Table C-6 presents freeze protection quantities permitted to agricultural WUPs by crop type. More information about the DPC WUCA is available at: <https://www.swfwmd.state.fl.us/projects/doover/plant-city-water-use-caution-area>

*Citrus Disease:* For over a decade, citrus groves across Florida have been fighting the Huanglongbing virus, commonly known to as citrus greening. In 2012, citrus irrigation jumped to a 20-year high of 289.1 mgd as farmers attempted to improve the health of trees by watering. Since then, the practice was determined ineffective, and Citrus acreage in the District has declined over the last ten years. Citrus irrigation was 182.1 mgd in 2022, below a 20-year average of 220.1 mgd. However, citrus still remains the dominant crop in the District.

### **COUNTY AND CROP TYPES**

Table 4 summarizes water use by county and by agricultural use groups based on similar crop types. The District's agricultural groupings are similar to those used by the Florida Department of Agricultural and Consumer Services. Citrus remains the largest crop use in the District at 55 percent of the total agricultural withdrawals. Tomatoes were the second largest crop at 9 percent. Figure 9 is a pie chart showing the percentage of water used for agriculture by each county. Polk County had the most agricultural water use in 2022 at 73.7 mgd.

### **GROUNDWATER & SURFACE WATER**

Groundwater was the source of 96 percent of the agricultural withdrawals (315.1 mgd) in 2022. Surface water resource withdrawals were 14.2 mgd. The surface water quantity represents withdrawals from natural resources exclusively; it does not include pumpage from tailwater recovery systems, storage ponds that are augmented with reclaimed water or stormwater,

or other alternative sources. This methodology focuses on the impacts to natural resources and prevents double-counting of pumpage from augmentation wells.

Numerous farms within the District have implemented conservation efforts that include alternative sources and reuse systems such as tailwater recovery ditches and ponds. This is an important distinction when using this report's data to study crop irrigation rates, as actual irrigation rates may exceed the reported withdrawals from natural resources.

### **Appendices**

Appendix A, Table A-7, provides permit-specific water use data for all metered agricultural WUPs. This table identifies quantities withdrawn, the total permitted quantities, and the permitted quantities specifically for agricultural use. The WUP's listed crop use code in Table A-7 is based on the WUP's largest permitted crop allocation, although the permittee may have multiple crop types.

Appendix A, Table A-8, provides the monthly withdrawal data by county. This is the data source for the monthly surface water and groundwater quantities in Figure 9.

Appendix B provides the specific groundwater and surface water use average quantities for each county, the WUCAs, and the FARMS priority watersheds. Table B-2 shows that Agriculture accounted for 45 percent of all water withdrawals in the SWUCA, exceeding public supply.

Appendix C shows the permitted annual average quantities for the District and within each WUCA by groundwater and surface water. Table C-1 shows that 731.0 mgd was permitted for agriculture Districtwide. 45 percent of the permitted agricultural quantities were pumped in 2022.

*FARMS Priority Watersheds:* The Districts' FARMS program (Facilitating Agricultural Resource Management Systems) has focus areas in the Upper Myakka and Shell Creek Watersheds (Figure 2). Appendix B, Tables B-6 and B-7 are provided to assist with tracking the success of agricultural conservation programs.

## **2022 ESTIMATED WATER USE REPORT**

Agricultural water use in the Upper Myakka watershed was 15.5 mgd, nearly all from groundwater. Agricultural water use in the Shell Creek watershed was 7.6 mgd, of which 58% was from groundwater.

The criteria for defining water users within the FARMS priority watersheds is slightly different than for the WUCAs. Any permittee having a controlled irrigation area within the watershed boundary is included, even if irrigation wells are located outside the boundary.

\* Data is only for the portion of the county within the District.

<sup>1</sup> Field crops include corn, grains, peanuts, other legumes, and commercial hay.

<sup>2</sup> Other includes Lawn & landscape irrigation by agricultural businesses (0.391 mgd), non-citrus fruit trees and vineyards (1.262 mgd), research (0.297 mgd), non-irrigation agriculture uses (0.249 mgd), and other unspecified uses.

# 2022 ESTIMATED WATER USE REPORT

## Percent of Agriculture Use by County

**Figure 9. Percentage of Agriculture Water Use by County, 2022**  
(Data source: Table 4)

## Agriculture Monthly Withdrawals and Rainfall

**Figure 10. Agriculture Surface Water and Groundwater Withdrawals (mgd/month) and District Regional Rainfall (inches/month), 2022**  
(Data Sources: Appendix A, Table A-8 and District rainfall data)

## **2022 ESTIMATED WATER USE REPORT**

### **MINING/DEWATERING WITHDRAWAL/USE = 17.8 MGD**

In 2022, 17.8 mgd was withdrawn from water resources for mining and dewatering activities in the District. This amount is up from the 14.6 mgd withdrawn in 2021 but below a ten-year average of 20.7 mgd. The dewatering activities for construction (non-mining) were only 0.02 mgd of this category.

#### **GENERAL INFORMATION**

The mining/dewatering water use category includes water for mining and processing of phosphate, peat, limestone, sand, shell, and gravel, as well as dewatering for construction activities such as borrow-pits or foundations.

The mining water uses quantified in this report may include water entrained in the mined product, water used to move slurry if it's discharged off-site, make-up of water losses in recirculation systems, water losses associated with washing and processing the product on-site, gypsum stack closure, augmentation withdrawals for environmental mitigation, irrigation of reclamation lands and facility landscapes, generation of electric power by mining operations (a process known as co-generation), maintenance of equipment and vehicles, fire suppression systems, and the sanitary water needs of employees.

The water used for on-site processing of mined materials at a local facility is included in this category, but water used at processing facilities for materials transported from off-site mines are categorized in the industrial/commercial category.

The District's method of permitting and quantifying mining/dewatering water use has been consistent since 2000. Prior to then, WUPs were based dewatering volume regardless of whether the water was recirculated on-site or discharged off-site. In some cases, pumped water would recirculate through shallow aquifers when discharged to nearby areas. WUPs issued after 2000 only count the water removed from local hydrologic systems as permitted discharges. This distinction is notable when evaluating long-term trends, which appear to have decreased after 2000.

Mining practices have improved their water efficiency over time. To conserve water, most of the mining operations today let the mined materials sit to dewater, and the effluent is recycled for other uses. The quantity of water entrained in the product is calculated by the mining operations and reported to the District.

Some withdrawal points for mining WUPs are identified as temporary "sealing wells." A sealing well provides water to transport mined products through pipelines as slurry. Water is introduced at various locations along a pipeline to keep the slurry flowing. Sealing water wells may be drilled as needed and then plugged when the pipeline is relocated. Due to their temporary nature, sealing water wells may be relocated without revising the WUP. If the slurry water is discharged off-site, the quantity is included as a resource withdrawal. If the slurry water is recirculated, sealing well withdrawals replace the net evaporative and other water losses associated with the slurry process.

The Mosaic Fertilizer Integrated WUP (#11400) had 131 active resource withdrawal points in 2022 located among multiple wellfields and processing facilities in four counties: Hardee, Hillsborough, Manatee, and Polk. The specific withdrawals have been allocated to the counties where they occurred for this report. The total consumptive withdrawals for the Mosaic Integrated WUP were 31.8 mgd, of which 17.2 mgd was for mining and the remainder was for off-site material processing that was categorized as industrial/commercial use.

#### **2022 DATA**

Table 5 summarizes county-level water use by mining product type (limestone, peat, phosphate, and sand/shell/gravel), as well as by sanitary/fire safety, general mining, and dewatering uses. Phosphate mining accounted for 97 percent of the water use in the category.

Figure 11 shows the percentage of mining/dewatering water use by each county. Polk County had the majority of use in 2022.

Figure 12 shows the monthly surface and groundwater mining/dewatering water use compared to rainfall. Mining water use trends are less influenced by rainfall than other

## **2022 ESTIMATED WATER USE REPORT**

predominant use categories that have a greater irrigation component.

### **Appendices**

Appendix A, Table A-9 provides water withdrawals and permitted quantities for metered mining/dewatering permittees, grouped by county. Table A-10 provides the average monthly withdrawals by county and water source. The adjustment for the multi-county Mosaic Fertilizer permit was applied to the monthly withdrawals within Hardee, Hillsborough, Manatee, and Polk counties.

Appendix B provides groundwater and surface water use quantities in 2022 by groundwater and surface water, by county, and by the WUCAs.

The tables in Appendix C provide the permitted quantities for mining/dewatering in 2022 by

county, by groundwater and surface water, and within each WUCA. Comparing the total use for mining/dewatering to the total permitted (52.1 mgd) indicates that 32 percent of the permitted quantities were utilized.

The Mosaic Integrated WUP's permitted quantity is 69.6 mgd (annual average), of which 44.6 mgd is allocated for mining/dewatering and 25.0 mgd is for industrial/commercial use. It should be noted that the WUP's permitted quantities are assigned to only Polk County in Appendix C. This is because the total permitted quantities are allowed to rotate and are not formally allocated among specific withdrawal points in each county. Any comparisons of "permit" quantities to "withdrawal" quantities for Hardee, Hillsborough, Manatee, and Polk counties should compensate for this difference.

## 2022 ESTIMATED WATER USE REPORT

Data source: Estimated Water Use Tables derived from the WMIS database.

\* Data is only for the portion of the county within the District.

# 2022 ESTIMATED WATER USE REPORT

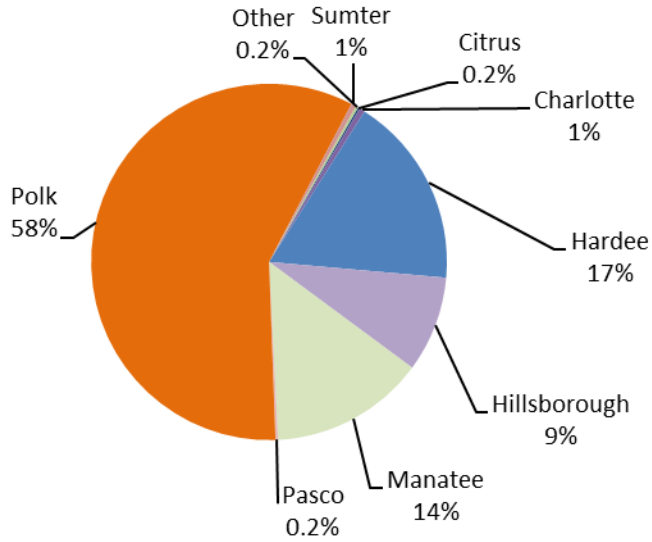

## Percent of Total Mining/Dewatering Use by County

**Total Use = 17.8 mgd**

"Other" includes DeSoto, Hernando, Highlands, Marion, and Sarasota Counties.

There was no measured use in Lake, Levy, or Pinellas counties.

Calculation includes only District portion of counties

**Figure 11. Percentage of Mining/Dewatering Water Use by County, 2022**

(Data source: Table 5)

## Mining/Dewatering Monthly Withdrawals and Rainfall

**Figure 12. Mining/Dewatering Surface Water and Groundwater Withdrawals (mgd/month) and District Regional Rainfall (inches/month), 2022**

(Data sources: Appendix A, Table A-10 District rainfall data)

## 2022 ESTIMATED WATER USE REPORT

### **INDUSTRIAL/COMMERCIAL WITHDRAWAL/USE = 60.2 MGD**

Approximately 60.2 mgd were withdrawn for industrial/commercial water uses in the District in 2022. This was an increase from 58.9 mgd withdrawn in 2021 and above a ten-year average of 57.7 mgd. Groundwater was the source of 83 percent of the industrial/commercial withdrawals.

#### **GENERAL INFORMATION**

The industrial/commercial water use category includes water permitted for product manufacturing, food processing, commercial and specialty businesses, power generation, and water used by the beverage industry including bottled water. This category includes some WUPs for institutions with housing (prisons, nursing homes, etc.) that were permitted prior to May 2014; however, those uses may eventually be recategorized to institutional use as the WUPs are renewed over time.

Industries and commercial businesses that purchase water from public supply utilities are not included in this category. Large public supply utilities report the water quantities sold to industrial/commercial customers in their PSARs. Detailed information on this public supply component is available in Appendix A, Table A-2. In 2022, public supply utilities sold 103.8 mgd of water to industrial/commercial customers.

#### **2022 DATA**

Table 6 shows the county-level water use by industry group type and by groundwater and surface water. Each use group is discussed below:

*Landscape Irrigation:* Approximately 0.2 mgd of the total was used for landscape irrigation by self-supplied industrial/commercial businesses. These are small allocations typically calculated as a portion of a permittee's well use. Businesses with large irrigation allocations may have dedicated irrigation wells and a multi-use WUP, in which case the withdrawals would be counted in the landscape/recreation category.

*Power Generation:* The water used from natural resources by permitted power facilities totaled 16.0 mgd. Power Generation uses may include water used for steam cooling, once-through

cooling flows, emission control, boiler feed and makeup water, personal sanitary needs for visitors and employees, and other small uses related to power plants. Some recently permitted power generation WUPs are for solar facilities that have relatively small allocations for maintenance, sanitary uses, and grazing animals for weed control. Seawater used for power generation cooling is not included, as it is not regulated by the District.

*Food Processing and Packing:* Food processing and packing uses totaled 3.9 mgd. Most of this use was for citrus processing facilities in Polk County.

*Beverage Processing:* Beverage processing includes water for content or dilution in beverage products, including bottled water. The quantity used was 1.3 mgd.

*Phosphate Processing:* When phosphate minerals are transported from the mine site where it was extracted to a separate processing facility, the water for processing is classified as an industrial/commercial use. Off-site phosphate processing totaled 21.3 mgd in 2022, with most of the processing in Polk County.

*Cement & Lime Processing:* This group includes water used for cement manufacturing, concrete batch plants, products made from cement or concrete, and lime processing for food, fertilizer, or water treatment. Water use for this category was 5.2 mgd.

*Manufacturing & Chemical Processing:* This group includes water used for numerous industries including asphalt manufacturing, biofuel generation, chemical manufacturing, and other general product manufacturing. The quantities may include either water in the product content or manufacturing needs such as cooling and cleaning. Water use for this category was 6.8 mgd.

*General/Specialty:* The general/specialty group includes various commercial businesses not specific to other groups such as car washes, laundries, water well contracting, and temporary water supplies for construction projects. The group also includes generalized commercial uses including water for air conditioners and boilers, personal sanitary use, cleaning, maintenance, emission control, refrigeration, product dilution, and equipment cooling. It also includes

## **2022 ESTIMATED WATER USE REPORT**

environmental augmentation related to industrial/commercial uses. Most of these uses are relatively small, but cumulatively they totaled 5.6 mgd in 2022.

Figure 13 shows the percentage of industrial/commercial use for each county. Over half of the industrial/commercial water use in the District occurred in Polk County. There are several large industrial/commercial permittees in Polk County including a phosphate processing plant, a regional power plant, chemical factories, and multiple food packing and distribution facilities.

Figure 14 shows monthly water use for the industrial/commercial category by surface water and groundwater sources and comparative monthly rainfall. Since irrigation accounts for a small fraction of this category, rainfall has less influence on this category than others. Surface water use for power plant cooling water is sometimes limited by availability.

### **Appendices**

Appendix A, Table A-11 provides WUP-specific information from the metered permittees. It

gives the water source, the total permitted quantity for each WUP, and how much of the permitted quantity is allocated for the industrial/commercial category. Table A-12 provides the average monthly withdrawals by county and water source and is the data source for Figure 14.

Appendix B provides groundwater and surface water use quantities in 2022 by groundwater and surface water, by county, and by the WUCAs.

Appendix C provides the quantities permitted in 2022 by county, by groundwater and surface water, and by the WUCAs. The Districtwide total permitted allocation for industrial/commercial uses was 141.8 mgd, and 42 percent of the allocation was used in 2022.

The permit allocation for the Mosaic Integrated WUP #11400 is 69.6 mgd, of which 25.0 mgd is allocated for industrial/commercial uses. In the Appendix C tables, this permit allocation is assigned solely to Polk County, the home county of the permittee. In 2022, the WUP's industrial/commercial withdrawals were mostly in Polk County.

Data source: Estimated Water Use Tables derived from the WMIS database.

\* Data is only for the portion of the county within the District.

<sup>1</sup> General/Specialty includes specialty commercial uses not specific to other groups such as car washes, laundries, water well contracting, and temporary supply for construction purposes. The group also includes general industry uses including water for air conditioners and chillers, personal sanitary use, boiler feed and makeup water (non-power plant), cleaning and maintenance, emission control, refrigeration, product dilution, equipment cooling, augmentation related to industrial/commercial, and other uses.

# 2022 ESTIMATED WATER USE REPORT

## Percent of Industrial/Commercial Use by County

**Figure 13. Percentage of Industrial/Commercial Water Use by County, 2022**  
(Data source: Table 6)

## Industrial/Commercial Monthly Withdrawals and Rainfall

**Figure 14. Industrial/Commercial Monthly Surface Water and Groundwater Withdrawals (mgd/month) and District Regional Rainfall (inches/month), 2022**

(Data sources: Appendix A, Table A-12 and District rainfall data)

## **2022 ESTIMATED WATER USE REPORT**

### **INSTITUTIONAL AND “OTHER” WITHDRAWAL/USE = 4.2 MGD**

Approximately 4.2 mgd were withdrawn for institutional and “other” water uses in the District in 2022. This was an increase from 3.5 mgd withdrawn in 2021, in part from more new permittees in the category.

In 2014, the institutional use and “other” predominant use categories were formally adopted into Chapter 40D-2.501 Florida Administrative Code, for consistency with the five water management districts. Other districts group institutional with industrial/commercial uses, and this EWU Report may follow in the future as permitting rules are updated.

By the end of 2022, there were 44 WUPs with categorized institutional water use, which was 7 more than in 2021. There were 13 WUPs using the “other” use category which was the same as year before. The numbers will continue to grow as WUPs with uses that fit these categories are renewed and issued.

#### **INSTITUTIONAL USE**

The institutional use category includes WUPs permitted to self-supplied hospitals, penitentiaries, universities, or other institutional facilities. Many institutions were traditionally permitted in other categories such as industrial/commercial or public supply. Some of the permittees are municipalities, but unlike the public supply category, the permitted use does not have an associated population (e.g., fire hydrants, dust control, street washing, maintenance).

The institutional uses include personal sanitary use, air conditioning supply, and landscape irrigation at schools, colleges, hospitals, and penitentiaries. It may also include fire-fighting supply, sports playing fields, fire systems, etc. The institutional use total was 2.9 mgd.

#### **“OTHER” USE**

The “other” use category mostly includes WUPs for environmental augmentation, along with water for aquatic habitats or other uses yet to be defined. Environmental augmentation was previously categorized with the predominant use that caused the environmental impacts.

Eleven of the 13 “other” WUPs active in 2022 were for environmental augmentation. The quantities are available to maintain minimum lake levels near regional wellfields in Pasco and Hillsborough counties, and minimum flows on the Hillsborough River. The augmentation withdrawals are operated to maintain surface water levels when they fall below specific trigger levels, as defined in environmental management plans. Augmentation is primarily needed during drought conditions, so demand is low when there is significant rainfall. In 2022, only 8 percent of the permitted allocation for environmental augmentation was used.

One permittee in the “other” category is a turtle breeding/research center in Polk County that uses water for aquatic habitats. Another is a small withdrawal on a conservation easement in Polk County that’s managed as a sand skink habitat.

#### **2022 DATA**

Table 7 provides the combined water use under the institutional or “other” categories. Figure 16 displays the monthly surface water and groundwater use in comparison to monthly rainfall. The evident surface water use in May to July was for environmental augmentation.

Appendix A, Table A-13 provides the specific uses and quantities for WUPs in this category. Both metered and estimated WUPs are included since the number of WUPs is relatively small. Table A-14 provides the monthly use quantities by county. Appendix B provides groundwater and surface water use quantities in 2022 by county and by WUCA. Appendix C provides the quantities permitted in 2022 by county, by groundwater and surface water, and by WUCA. The permitted allocations for institutional use were 4.4 mgd and for “other” uses were 14.6 mgd.

# 2022 ESTIMATED WATER USE REPORT

## Percent of Institutional/Other Use by County

**Figure 15. Percentage of Institutional and "Other" Water Use by County, 2022**  
(Data source: Table 6)

## Institutional & "Other" Monthly Withdrawals and Rainfall

**Figure 16. Institutional and "Other" Monthly Surface Water and Groundwater Withdrawals (mgd/month) and District Regional Rainfall (inches/month), 2022** (Data sources: Appendix A, Table A-14 and District rainfall data)

## **2022 ESTIMATED WATER USE REPORT**

**DISTRICTWIDE TOTALS**  
**WITHDRAWALS = 1,110.2 MGD**  
**USE = 1,086.9 MGD**

The total amount of water *withdrawn* from water resources in the District was calculated as 1,110.2 mgd. The total *withdrawals* are up from 1,095.3 mgd in 2021 and are above a ten-year average of 1,074.8 mgd. Withdrawals increased from 2021 in all categories except landscape/recreation.

This report quantifies public supply *withdrawals* and *uses* separately because supplies are often stored and transported where needed, but for other categories *withdrawals* and *use* are assumed the same because the supply is typically used where and when it's withdrawn. After factoring public supply *use* into the District total, the total water *used* in the District was calculated as 1,086.9 mgd, which was an increase from 1,071.3 mgd *used* in 2021.

### **2022 DATA**

The 2022 data was based on 6,853 WUPs active during the year with a combined 16,687 resource withdrawal points (groundwater wells or surface water intakes), plus reported seawater desalination production and demographic estimates for domestic self-supply use. Only 30 percent of the active WUPs were required to submit metered water use to the District on a monthly or daily schedule. However, the permitted quantities of most metered WUPs are orders-of-magnitude greater than unmetered WUPs. Tables 8a and 8b show the historical metered quantities and the number of metered and unmetered WUPs.

Table 9 provides the totals of water *withdrawn* and water *used* in the District in 2022 by use type and county, as summarized from the prior chapters. The public supply *use* accounts for imports, exports, treatment losses, and net storage changes in ASR or off-stream reservoirs; which can vary greatly by county from *withdrawn* quantities. Figure 17 provides a pie-chart comparison of quantities *withdrawn* and *used* by county.

Table 10 provides a comparison of *permitted* quantities to *withdrawn* quantities. The total quantity *permitted* was 1,913.1 mgd annual average and 58 percent of the allocations were utilized. A substantial unused permitted quantity is expected because permit allocations provide for demands during drought conditions and for the future projected needs that may increase over the duration of the permit. The domestic self-supply permit quantities are zero because the domestic wells are not regulated by the WUPs.

Tables 11 and 12 provide a similar comparison of permitted and withdrawn quantities for the metered and estimated WUPs only. The total metered withdrawals on Table 11 are 85 percent of the total withdrawals on Table 10. As noted in prior chapters, a few large WUPs with multi-county withdrawals have their permitted allocation assigned solely to their home county, but their *withdrawals* are sorted among the counties where they occurred.

Figure 18 compares the amount of groundwater and surface water *withdrawn* in each county in 2022. The figure illustrates that Polk County has the most groundwater *withdrawals*. Hillsborough County had the greatest total *withdrawals*, but with less groundwater than Polk County due to offsets by surface water alternative supplies. Appendix B, Table B-1 contains the data presented in this graph.

Figure 19 compares the monthly groundwater and surface water *withdrawals* to Districtwide average monthly rainfall. The figure demonstrates a general trend that monthly groundwater *withdrawals* are inversely proportionate to the amount of monthly rainfall since irrigation demands are a significant portion of water use. The average rainfall in 2022 was 56.5 inches Districtwide, which was above the historic mean average of 52.9 inches. Rainfall during several months was below average, particularly in the first half of the year. However, September had a record-high monthly rainfall of 14.6 inches when Hurricane Ian made landfall by Fort Myers and crossed northeast across the state.

## **2022 ESTIMATED WATER USE REPORT**

Figure 20 illustrates the Districtwide groundwater and surface water *withdrawals* by predominant use category. This figure illustrates how public supply is the largest use category, and in 2022 public supply accounted for more groundwater *withdrawals* than agriculture.

### **APPENDICES**

Appendix A, Tables A-1, A-2, and A-3 provide WUP-specific public supply water use data including the withdrawals and use, water transfers among utilities, per capita ratios, and specific uses within the public supply category. These tables summarize the data reported by utilities in their PSARs, regional imports from water supply authorities, and the metered and estimated data for the public supply WUPs that aren't required to submit a PSAR. There are some utility-specific differences between PSAR-reported uses and the total public supply estimates which are footnoted.

Appendix A, Tables A-5, A-7, A-9, A-11, and A-13 provide detailed listings of the quantities permitted and withdrawn for each metered WUP in the landscape/recreation, agriculture, mining/dewatering, industrial/commercial, and institutional/"other" use categories respectively. WUPs that have allocations for more than one predominant use type will appear in more than one table.

Appendix A, Tables A-4, A-6, A-8, A-10, A-12, and A-14 show the monthly average withdrawals by county for the predominant water use categories. The quantities are based on monthly or daily metered data recorded in WMIS. Estimated shares are included in the totals and are based on monthly usage trends.

Appendix B tables show the total annual average quantities *withdrawn* specifically by

groundwater and surface water sources for each county, regulated water use category, and within each WUCA. Seawater desalination supply and domestic self-supply estimates are excluded from these tables because these sources are not regulated by the District. Tables B-6 and B-7 quantify water use within the FARMS priority watersheds of Upper Myakka and Shell Creek, respectively.

Appendix C identifies the total permitted annual average quantities from surface water and groundwater by county for the District and the WUCAs. Tables C-6 and C-7 contain freeze protection quantities permitted for agricultural use in the DPC WUCA.

Appendix D gives a ten-year history of the per capita use for public supply WUPs permitted for 100,000 gpd or more on an annual average basis. Table D-1 provides gross per capita values, and Table D-2 provides compliance per capita and a 5-year average.

Appendix E shows the calculations for the DEP uniform per capita rates (gross and residential). The DEP has specified a consistent methodology to compare water efficiency across the five water management districts for state-wide analysis.

Appendix F provides technical details on the methodology used to make the EWU report, along with some history of changes to the reports. Some refinements may occur each year. Quality controls, data point error corrections, and reasonability assumptions are also discussed. It is recommended to consider the methodology used for this report before comparing its information to data from prior EWU reports or other sources.

## 2022 ESTIMATED WATER USE REPORT

**Table 8a. Summary of 10 Years Metered Water Use Data, 2013 - 2022**

<b>Pumpage from Metered Withdrawal Points, 2013 to 2022, mgd annual average</b>											
Use type	Year	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022

District Total <sup>1</sup>	1,913.06	7,069	1,690.36	2,124	222.692	4,945

Data Source: District Water Use Permit Database, Calendar Year.

<sup>1</sup> The number of permits in this table reflects 98 duplicate counts of permits that had more than one use. The distinct count of WUPs evaluated for this report was 6,853 total; 2,026 metered; and 4,827 estimated. Public Supply wholesale WUPs are excluded from the count as they have no permitted quantities.

\* Data is for only the portion of the county located within the District boundaries.

<sup>1</sup> Total Withdrawal - Represents the sum of the preceding seven columns and represents total water withdrawal by county for all categories.

<sup>2</sup> Public Supply Use - Represents total consumptive use of public supply water within a county. The difference from public supply withdrawals is the accounting of imports or exports of publicly supplied water from one county to another, treatment losses, and net change of storage in off-stream reservoirs or ASR systems.

<sup>3</sup> Total Use = The sum of "Total (Withdrawal)" minus "Public Supply (Withdrawal)" and including "Public Supply (Use)."

<sup>4</sup> Mosaic Consolidated Permit (#11400) withdrawals are shown in the county in which they occurred (Hardee, Hillsborough, Manatee, and Polk counties).

<sup>5</sup> Tampa Bay Water Consolidated Permit (#11771) withdrawals are shown in the county in which they occurred (Hillsborough, Pasco, and Pinellas counties).

<sup>6</sup> Hillsborough County Public Supply Withdrawal/Use Quantities include 8.03 mgd of Tampa Bay Water's seawater desalination effluent. Seawater is not regulated by the District, and the quantity is not included in Table 10 and some other tables representing only permitted water resources.

\* Data is for only the portion of the county located within the District boundaries.

Rounding errors of less than 0.1 percent may exist when comparing to other tables.

Tampa Bay Water Consolidated WUP (#11771) permitted allocation (90 mgd) is assigned to Hillsborough County, but withdrawals are counted in the county where they occurred (Hillsborough, Pasco, and Pinellas counties).

Mosaic WUP (#11400) permit allocations for Mining (44.6 mgd) and Industrial/Commercial (25.0 mgd) are assigned to Polk County, but withdrawals are counted in the county in which they occurred.

Data source: Estimated Water Use Tables derived from the WMIS database, and 2022 PSARs.

# 2022 ESTIMATED WATER USE REPORT

## Percentage Total Water Withdrawn by County

**Total Withdrawals = 1,110 mgd**

Data only for the portion of the counties within the District.

## Percentage Total Water Used by County

**Total Use = 1,087 mgd**

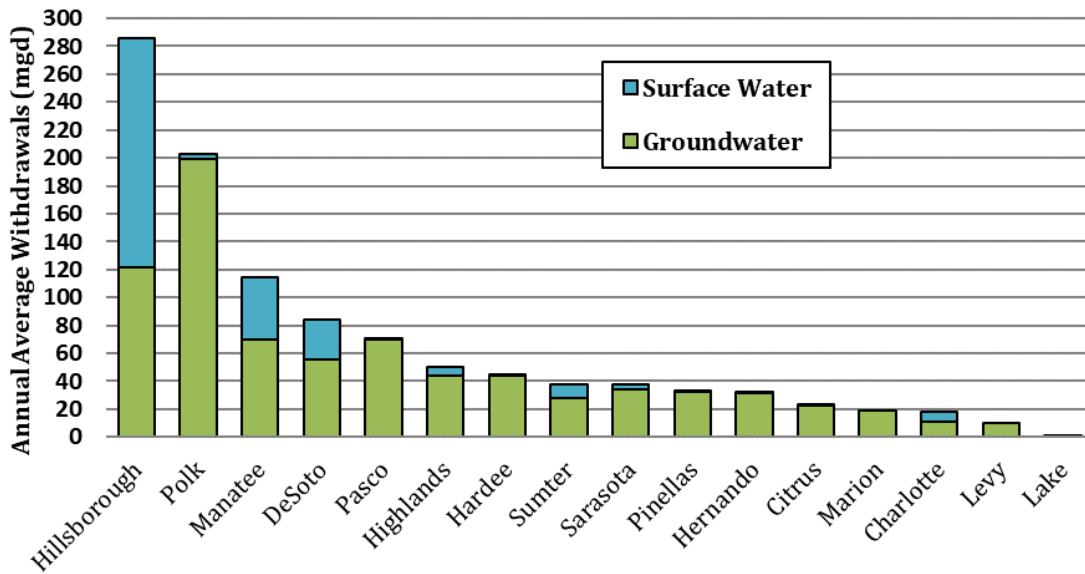

Data only for the portion of the counties within the District.

**Figure 17. Percentages of Total Withdrawals and Total Use by County, 2022**  
(Data Source: Table 9)

## 2022 ESTIMATED WATER USE REPORT

### Total Groundwater and Surface Water Withdrawals by County in 2022

**Figure 18. Total Groundwater and Surface Water Withdrawals by County, 2022**  
 (Data Source: Appendix B, Table B-1. The domestic self-supply category is excluded.)

### Total Groundwater and Surface Water Withdrawals and Rainfall by Month

**Figure 19. Total Groundwater and Surface Water Withdrawals by Month and Total Monthly Rainfall, 2022**

(Data sources: Sum of quantities provided in Appendix A, Tables A-4, A-6, A-8, A-10, and A-12; and District rainfall data. The domestic self-supply category is excluded.)

# 2022 ESTIMATED WATER USE REPORT

**BY WATER USE PERMIT**

# **2022 ESTIMATED WATER USE REPORT**

## **IMPORTANT INFORMATION REGARDING TABLE A-1**

Table A-1, Part 1 lists primary information from Public Supply Annual Reports (PSARs) reported by the permittees of major public supply water use permits (WUPs) throughout the District. A permittee having a public supply WUP issued for 100,000 gpd or more is required under Chapter 40D-2 Water Use Permits, F.A.C., to submit a completed PSAR by April 1st of each year. If a PSAR was not received from a utility, the data may be estimated using metered pumpage that was reported monthly or daily through the year and the BEBR-based population estimates. Some differences may occur between the PSAR forms submitted by permittees and the published data due to the author's intent to provide accuracy and consistency for water use estimates in all use categories.

The PSAR water use information that is presented in Table A-1, Part 1 includes:

- Permitted quantity
- Total withdrawals and use
- Water source type
- Imports from any source, such a water supply authority or neighboring utility
- Exports to any receiver, such as another public supply permittee
- Treatment plant losses
- Significant uses, typically large customers with no associated population
- Environmental mitigation
- Golf course irrigation use
- Service population estimates
- Stormwater uses that are eligible for compliance deductions
- Reclaimed water exports to other users, which are eligible for compliance deductions
- Per capita water use calculations

## **Per Capita Rates:**

The water use per capita is a widely used ratio measurement of water use/population. Three types of per capita are provided in Table A-1: "unadjusted gross," "adjusted gross," and "compliance" per capita. A "residential" per capita use is also calculated and shown in Table A-2. Each of the per capita measures are described on pages 19-20 of the EWU Report. Additional information can be found in of the WUP Applicant's Handbook, Part B: <https://www.swfwmd.state.fl.us/media/document/3166>

## 2022 ESTIMATED WATER USE REPORT

### Record of Public Supply Annual Reports Received and Number of WUPs in compliance with the 150 gpcd compliance per capita requirement.

	No. WUPs		No. WUPs	No. WUPs	No WUPs
PSAR Received	130	Unadjusted Gross PC ≤ 150:	113	Adjusted Gross PC ≤ 150:	117
PSAR Not Received	0	Unadjusted Gross PC > 150:	16	Adjusted Gross PC > 150:	12
Wholesale WUPS with PSAR	11	Unadjusted Gross PC = NA	1	Adjusted Gross PC = NA	1
				Compliance PC ≤ 150:	121
				Compliance PC > 150:	8
				Compliance Gross PC = NA	1

**Notes:**

Calculations from raw data may create minor rounding discrepancies in summations.

gpcd: gallons per capita day (gallons per day per person)

mgd: million gallons per day

- \* If the PSAR was not received, withdrawals were derived from District metering data, and population was calculated from District GIS data.
- 1 The permitted quantity that the WUP is allowed to withdrawal on an annual average basis.
- 2 The annual average withdrawals reported by utility or water supply authority.
- 3 Signifies if a PSAR was received by the District. If a PSAR was required but not received, "N" is noted in this column and the District's data and demographics were used.
- 4 GW = Groundwater, SW = Surface Water, RO = Brackish groundwater treated by desalination, SEA = Seawater treated by desalination
- 5 IMPORT = Water purchased or transferred in bulk from another utility or water supply authority.
- 6 EXPORT = Water sold or transferred in bulk to another utility or water supply authority.
- 7 TREATMENT LOSS = Annual average gallons per day which are lost in routine treatment for potability. This includes, but is not limited to, desalination reject water, sand filtration backwash, and quantities used to maintain appropriate water quality in pipelines or tanks. Treatment losses are calculated as raw water into the plant minus treated water out of the plant. This should not include more than 1 percent of treated water volume delivered to the distribution system for flushing distribution lines for potability.
- 8 GROSS USE = (Withdrawal + Import) - (Export + Treatment Loss) +/- (storage, not quantified in table, in ASR or offstream reservoirs). The Gross Use is the water distributed to utility customers.
- 9 POPULATION SERVED = permanent population + adjusted seasonal population + tourist (optional) + net commuters (optional). Information on functional population methodology is available in the District's Water Use Permit Information Manual, Part D: [http://www.swfwmd.state.fl.us/files/database/site\\_file\\_sets/14/wup\\_part\\_d.pdf](http://www.swfwmd.state.fl.us/files/database/site_file_sets/14/wup_part_d.pdf).
- 10 UNADJUSTED GROSS PER CAPITA = (Gross Use) ÷ (Functional Population). Population-related withdrawals associated with residential, business, institutional, industrial, miscellaneous metered, and unaccounted water uses are applicable to all public supply benefits.
- 11 SIGNIFICANT USE DEDUCTION = A Significant Use is a substantial amount of water provided for industrial/commercial (I/C) use and that is not related to population. Permittees are allowed to deduct significant use under five options: A: Single significant Use; B: Districtwide percent I/C use; C: Combined regional government and higher education facilities; D: Individual regional health facilities; E: Individual I/C facilities where water is the primary ingredient or the final product. Definitions and exclusions of each type are given in the Basis of Review for Water Use Permit Applications, Chapter 3, Section 3.6.
- 12 GOLF COURSE DEDUCTION = Separately metered golf course irrigation quantities from ground water, surface water, reclaimed water, or storm water provided to golf courses inside the service area. The permitted quantities for the service area and reported as withdrawals (WD) in the Annual Report. The golf course deduction quantities shall not exceed those actually provided, or those that would be permitted for use by the District, whichever is less. Quantities provided may be deducted only if they are included in the permit.
- 13 ENVIRONMENTAL MITIGATION = Annual average quantities used by a utility to mitigate withdrawal-related stress to a specified environmental feature as required by the utility's WUP.
- 14 ADJUSTED GROSS PER CAPITA = ((Gross Use) - (Significant Uses + Golf Course Deduction + Environmental Mitigation) ÷ Functional Population).
- 15 STORMWATER DEDUCTION = Separately metered and reported stormwater quantities captured by the permittee that are included in the utility's permitted quantities for uses inside the service area, and for uses other than for golf course irrigation (GC). The stormwater withdrawal quantities deducted shall not exceed the quantities actually provided, or those that would be permitted for the use by the District, whichever is less. The surface withdrawal points from the stormwater catchments shall be permitted on the provider's water use permit and must be reported as withdrawals in the PSAR to be deducted. The stormwater deduction is not taken where the quality of the groundwater source is of lower water quality but is suitable for the intended use unless the stormwater use reduces adverse impacts to the water resources.
- 16 RECLAIMED WATER DEDUCTION = A deduction from the gross per capita that is applicable if the utility provides reclaimed water for beneficial use to an area as set forth in the Basis of Review for Water Use Permit Applications, Chapter 3, Section 3.1.

## **2022 ESTIMATED WATER USE REPORT**

<sup>17</sup> COMPLIANCE PER CAPITA = [(gross use) - (significant use + golf course deduction + environmental mitigation + stormwater deduction + reclaimed water deduction)] / (Functional Population). This is a rate that is calculated for compliance with the 150 gpd per person limit.

**The following footnotes pertain to specified utilities and District total**

<sup>18</sup> Regional Water Supply Exporter.

<sup>19</sup> The PSAR reported withdrawal totals for some permittees with multi-use permit quantities containing water that was categorized as landscape/recreation or industrial/commercial in other chapters of the EWU Report. To avoid double-counting, the EWU Report Table 1 contains deductions in the countywide public supply withdrawals. This causes some discrepancies with Table A-1.

<sup>20</sup> The City of Lakeland (WUP 4912) and the City of Tampa (WUP 2062) provided "water year" (Oct-Sept) data on their PSARs. Table A-1 retains their reported data, but calendar year data (Jan-Dec) was substituted for EWU Report table 1. Their calendar year withdrawals were 23.443 mgd at Lakeland and 79.630 at Tampa.

<sup>21</sup> The City of Tarpon Springs (WUP 742) is in Pinellas County but has 3 of its 26 supply wells just over the border in Pasco County. The wells in Pasco withdrew 0.690 mgd, or 12% of the City's withdrawal total. The EWU Report Table 1 county withdrawal totals include this adjustment.

<sup>22</sup> The Villages CDD withdrawal quantity shown included 10.117 mgd of withdrawals from an advanced stormwater pond system, an alternative supply which was reported in the PSAR to balance their gross use and water losses. The Villages CDD groundwater withdrawals were within their permitted allocation of 19.346 mgd.

Please note that data in these tables may not exactly match what was reported in the PSARs due to rule requirements [40D-2.091(1)(a)], supporting documentation conditions, and staff quality evaluation. In addition, the data from the Water Management Information System (WMIS) is subject to updates. Further, the Estimated Water Use process includes scaling and fractioning of withdrawal point and use data.

## 2022 ESTIMATED WATER USE REPORT

**Table A-1, Part 2. Metered Withdrawals for Public Supply WUPs that aren't required to submit a PSAR, Permitted Quantities (mgd), and Countywide Estimates for Non-Metered WUPs, 2022**

County	WUP Number	Permittee	Use Code <sup>1</sup>	Source <sup>2</sup>	Annual Average Withdrawal <sup>3</sup>	Total Permitted Annual Average Quantity	Permitted Quantity Attributed to Public Supply <sup>4</sup>
<b>District Totals</b>					<b>193.953</b>	<b>Metered, Non-PSAR, mgd</b>	
					<b>3.966</b>	<b>Estimated, mgd, 162 WUPs</b>	
					<b>197.919</b>	<b>Public Supply Total (mgd) for non-PSAR WUPs</b>	

Data source: Estimated Water Use Tables derived from the WMIS WUP database.

**Notes:**

- <sup>1</sup> Use Code: Alpha-numeric code to identify largest specific use attributed to the permit. The first letter indicates the "predominant use" (P = Public Supply). Each WUP may have multiple use codes, but the largest specific use within the category is shown. Descriptions of the use codes are provided below.
- <sup>2</sup> Source: G = Groundwater; S = Surface Water
- <sup>3</sup> The annual average withdrawals by each permittee under the public supply use category, in million gallons per day. The totals show the sum of metered withdrawals, an additional amount estimated for the non-metered permittees, and the combined total for the county and District.
- <sup>4</sup> The Public Supply portion of the total permitted quantity. If the number is less than the total permitted quantity, there are uses other than Public Supply on the WUP.

The public supply use codes that are used in WMIS are provided below. There are more use codes listed, for reference, than appear in Table A-1, Part 2. Codes in italics are discontinued but may still appear in WMIS until WUPs are renewed.

P020	Augmentation for Environmental	P082	General Landscape Recreation	P130	Residential Single Family
P025	Aquifer Depletion Mitigation	P083	Golf Course Irrigation by Public Supply	P131	Residential Mobile Home
P040	Commercial/Industrial	<i>P090</i>	<i>Other Uses (Unmetered)</i>	P135	Temporary Employee Housing
P050	Desalination Reject	P100	Personal Sanitary Use	P140	Treatment Losses (Back-flushing)
P060	Fire Fighting/Testing	P105	Regional Public Supply System	P150	Unaccounted Use
P070	Lawn & Landscape Irrigation	P110*	Quantities Supplied by External Source	P160	Water Utility Use (Maintenance, Flushing, etc.)
P075	Common Area Irrigation	P112	Quantities Sold or Provided to Another Utility	P170*	Reuse Water to Customers in Service Area
P080	Other Metered Uses	P115	Residential (Provided by Non-Utility)	P175*	Reuse Water Supplied within Service Area
P081	Cooling	P120	Residential Multi-Family	P180*	Reuse Water to Customers outside Service Area
				P181	Line Flushing

\* The uses P110, P170, P175, and P180 are excluded from the estimated water use query.

## 2022 ESTIMATED WATER USE REPORT

**TABLE A-2.** This table presents information provided by permittees on Part B of the PSAR form, which identifies specific customer use categories. The gross use is the same amount shown in Table A-1. The specific use categories provided are:

- RES: The residential use is the sum of water supplied to single family and multifamily dwellings, mobile homes, and RV parks.
- I/C: Industrial/commercial.
- AG: Agriculture.
- L/R: Landscape/recreation, use excluding golf courses.
- GC: Golf course irrigation.
- F&O: The portion used for fire systems and other quantified ancillary water needs.
- WL: Water Losses, calculated as any discrepancies between the amount of water leaving the treatment plant and the sum of amounts quantified at the customer meters. Water losses may result from a variety of issues including pipeline leaks and breaks, users tapping into supply lines illegally, or under-registering the customer meters.

The residential use quantities are divided by the functional population to generate a residential per capita rate. The countywide residential per capita rates are used to estimate the domestic self-supply quantities in the EWU Report.

**Table A-2 NOTES:**

The totals for Gross Use, Population Served, and Gross Per Capita listed in Table A-2 may not match those listed in Table A-1. This is because not all of the permittees are listed in Table A-2, either they have never submitted Part B of the PSAR form, or they only export water wholesale to other public supply utilities.

- 1 Gross Use is taken directly from Table A-1 and represents the total amount of water withdrawn plus imports minus exports and treatment loss.
- 2 Percent of water supplied that is used for residential purposes only.
- 3 Percent of water supplied that is used for industrial/commercial purposes only.
- 4 Percent of water supplied that is used for agricultural purposes only.
- 5 Percent of water supplied that is used for landscape/recreation purposes only.
- 6 Percent of water supplied that is used for golf course irrigation only.
- 7 Percent of water supplied that is used for firefighting, line flushing, and other accountable (F&O) purposes only.
- 8 Percent of water supplied that is considered lost or unaccounted for due to system leaks, illegal connections, etc.
- 9 Residential Use = (Gross Use) X (% Residential). This number represents the total amount of water that is used for residential purposes only.
- 10 Population Served is taken directly from Table A-1, column 11, and represents the served population for the permittee listed.
- 11 Residential per capita = (residential water use) / (population served). This number represents the average quantity of water used per person per day for residential purposes only.
- 12 I/C Use (Industrial/Commercial Water Use) = (Gross Use) X (% I/C). This number represents the amount of Public Supply water that is used for Industrial/Commercial purposes only.
- 13 AG Use (Agriculture Use) = (Gross Use) X (% AG). This number represents the amount of Public Supply water that is used for Agriculture purposes only.
- 14 L/R Use (Landscape/Recreation Use) = (Gross Use) X (% REC/AES). This number represents the amount of Public Supply water that is used for Recreational purposes only.
- 15 GC Use (Golf Course Use) = (Gross Use) X (% GC). This number represents the amount of Public Supply water that is used for Golf Course purposes only.
- 16 F & O Use (Fire and Other) = (Gross Use) X (% F&O). This number represents the amount of Public Supply Water that is used for Fire Supply and Other purposes only.
- 17 WL (Water Loss) = (Gross Use) X (% WL). This number represents the amount of water that is lost or unaccounted for each day by the permittee listed.

## 2022 ESTIMATED WATER USE REPORT

**Table A-3.** This table shows the transfers of water between public supply permittees in the District, as well as to some communities outside of the District. The chart is sorted by the importing county and WUP (left side). Some discrepancies occur, see note below table.

**Table A-3. 2022 PSAR Utility Permit-to-Permit Water Transfers**

Data Source: Public Supply Annual Reports and Tampa Bay Water's daily operation reports.

Notes: Some reporting discrepancies occur between imports and exports of corresponding utilities. Discrepancies can be caused by transfer water losses, meter accuracy, a small quantity reported by only one entity, unresolved reporting errors, or other reasons. This table includes conflicting available data if differences weren't reconcilable. Quantities exported by regional water supply authorities may be stored and blended from multiple sources, so they were considered transfers to/from a regional system.

\* Data is only from the portion of the county within the District.

Data source: Estimated Water Use Tables derived from the WMIS database.

The average of monthly withdrawal totals from the WMIS database may vary from annually-reported PSAR-based withdrawal estimates. The TBW Consolidated Wellfield (WUP 11771) point withdrawals are allocated in the county where they occurred. Seawater desalination and stormwater uses were excluded.

## 2022 ESTIMATED WATER USE REPORT

Information is given only for the portion of the county within the District.

Source: WMIS Database. Calculations from raw data create some minor rounding discrepancies in summations.

- 1 Use Code: Alpha-numeric code to identify largest specific use attributed to the permit. The first letter indicates the "predominant use" (R = Landscape/Recreation). The WUP may have multiple use codes, but largest specific use within the category is shown. Descriptions of the use codes are provided below.
- 2 Source = G for groundwater; S for surface water
- 3 The metered annual average amount withdrawn by the permittee during the calendar year, in million gallons per day. The county totals show the sum of metered withdrawals, an additional amount estimated for the non-metered permittees, and the combined total for the county.
- 4 The share of Permitted Quantity allocated for the subject Predominant Use. If the value is less than the total permitted quantity, there is another predominant use allocated to the WUP. There may be additional withdrawals by the permittee for the other use on another table.

**Descriptions for the Landscape/Recreation use codes used in WMIS. There are more codes listed, for reference, than are shown in Table A-5.**

R200 Aesthetic Use (not augmentation)	R300 Recreational Animal Watering Use	R410 Flume
R210 Augmentation for Aesthetic	R301 Water for Aquatic Habitats	R411 Pool/Pond Fill
R220 Augmentation for Environmental	R310 Personal Sanitary Use	R412 Pool/Pond Makeup
R230 Cemetery/Parks/Playgrounds	R320 Water-Based Recreation	R413 Rides
R240 Lawn & Landscape Irrigation	R321 Water Parks	R414 Food preparation and associated water needs
R244 Irrigation of Common Areas	R400* Reuse Water Received from a Utility	R415 Office / Staff Facilities
R245 Sports Playing Fields	R401* Reuse Water Generated on Site	R420 Public drinking fountains/ Restrooms
R250 Golf Course	R405* Closed Loop Heating and Cooling	R425 Hotel/Motel
R260 Botanical Specimen Irrigation	R406 Animal Watering	R430 Fountains
R261 Botanical Specimen (wo eff. Rainfall)	R407 Aquatic habitat fill	R435 Decorative Water Features
R270 Fire Fighting/Testing	R408 Aquatic habitat water change	R440 Cleaning and Maintenance
R280 Maintenance & Cooling	R409 Aquatic habitat water replacement	R445 Air Conditioning/Cooling
R290 Other Uses		

\* Uses R400, R401, and R405 are excluded from the estimated water use query.

## 2022 ESTIMATED WATER USE REPORT

Notes:  
 Six Agricultural WUPs listed in Table A-7 above had a significant amount of withdrawals in multiple counties, so the withdrawals were split among county totals in the report.  
 WUP 2715 was split for Sod use in both Polk (=1.106-0.450 mgd) and Hardee (+0.450 mgd) counties.  
 WUP 3275 was split for Citrus in both Charlotte (=0.255 - 0.133 mgd) and DeSoto (+0.133 mgd) counties.  
 WUP 5918 was split for Pasture in Hardee (=0.230 - 0.180) and Polk (+0.180) Counties.  
 WUP 6915 was split for Hay in both Manatee (=0.139-0.032 mgd) and DeSoto (+0.032 mgd) counties.  
 WUP 7998 was split for Citrus both Manatee (=0.437 - 0.127 mgd) and Hardee (+0.127 mgd) counties.  
 WUP 9741 was split for Citrus in both DeSoto (=0.512-0.060 mgd) and Manatee (+0.060 mgd) counties.  
 Additional WUPs exist that have minor overlaps of county borders.  
 Minor rounding discrepancies may occur in summations of raw data.

Notes continued:

- 1 Use Code: Alpha-numeric code to identify largest specific use attributed to the permit. The first letter indicates the “predominant use” (A = Agriculture, L = Livestock). Each WUP may have multiple use codes, but largest specific use within the category is shown. Descriptions of the use codes are provided below.
- 2 Source = Groundwater (G), Surface Water (S)
- 3 The metered annual average withdrawals by each permittee under the Agricultural use category, in million gallons per day. The totals show the sum of metered withdrawals, an additional amount estimated for the non-metered permittees, and the combined total for the county and District.
- 4 The share of the permit quantity allocated for agricultural uses. If the value is less than the total permitted quantity, there is another predominant use allocated to the WUP, and there may be additional withdrawals listed in another table.

**Descriptions of Agricultural Use Codes.** This list contains more codes than are shown in Table A-7 for reference. Codes in italics have been discontinued but may still exist in the WMIS database until the permits are modified.

## 2022 ESTIMATED WATER USE REPORT

Notes:

- 1 Use Code: Alpha-numeric code to identify the largest specific use attributed to the permit. The first letter indicates the “predominant use” (M = mining/dewatering). Each WUP may have multiple use codes but largest specific use within the category is shown. Descriptions of the use codes are provided below.
- 2 Source = Groundwater (G) or Surface Water (S)
- 3 The metered annual average withdrawals by each permittee under the mining/dewatering use category, in million gallons per day. The totals show the sum of metered withdrawals, an additional amount estimated for the non-metered permittees, and the combined total for the county.
- 4 The share of Permitted Quantity allocated for the subject Predominant Use. If the value is less than the total permitted quantity, there is another predominant use allocated to the WUP. There may be additional withdrawals by the permittee for the other use on another table.
- 5 The Mosaic Fertilizer Integrated Water Use Permit (#11400) permitted quantity is assigned to Polk County, but the permit has withdrawal points located in Hardee, Hillsborough, Manatee, and Polk counties. The metered withdrawals are allocated to the county where they occurred.

Descriptions of mining/dewatering use codes are provided below. There are more codes listed, for reference, than are shown in Table A-9.

M905	Augmentation for Environmental	M935	Personal Sanitary Use	M975	Shell Processing
M910	Lawn & Landscape Irrigation	M940	Phosphate Ore Processing	M976	Water Entrained with Product
M911	Plant/Facilities Mining	M945	Phosphate Pit Dewatering	M980	Fire Protection/Testing
M912	Outside Use (washing/maintenance)	M950	Phosphate Water Table Dewater	M985*	Recirculated Mining Quantities
M915	Limestone Processing	M955	Reclamation Irrigation	M990	Water Discharged Off-Site
M920	Limestone Quarry Dewatering	M960	Sand & Gravel Processing	M995	Environmental Dewatering
M925	Mining Other Uses	M965	Sand & Gravel Dewatering	M996	Dewatering for construction
M930	Peat Mine Dewatering	M970	Shell Pit Dewatering	M999	Gypsum Stack Closure

\*Use M985 is excluded from the estimated water use query.

\* Data is only from the portion of the county within the District.

Source: Estimated Water Use Tables derived from the WMIS WUP database.

Data for the Mosaic Fertilizer multi-county permit (WUP 11400) were adjusted manually per well, so withdrawals are represented in the county where they occurred.

The average of monthly withdrawal totals from the WMIS database may vary from other tables due to MD/IC allocation adjustments on WUP 11400.

Source: District WMIS database. Totals are calculated from raw data which creates some minor rounding discrepancies in summations.

- 1 Use Code: Alpha-numeric code to identify largest specific use attributed to the permit. The first letter indicates the “predominant use” on the permit. (I = Industrial/Commercial). Each WUP may have multiple use codes, but largest specific use within the category is shown. Descriptions of the use codes are provided below.
- 2 Source = Groundwater (G) or Surface Water (S)
- 3 The annual average withdrawals by each permittee under the industrial/commercial use category, in million gallons per day. The totals show the sum of metered withdrawals, an additional amount estimated for the non-metered permittees, and the combined total for the county.
- 4 The share of Permitted Quantity allocated for the subject Predominant Use. If the value is less than the total permitted quantity, there is another predominant use allocated to the WUP. There may be additional withdrawals by the permittee for the other use on another table.
- 5 The Mosaic Fertilizer Integrated Water Use Permit (#11400) permitted quantity is assigned to Polk County, but the permit has withdrawal points located in multiple counties. The metered withdrawals are allocated to the county where they occurred.

## 2022 ESTIMATED WATER USE REPORT

Descriptions for the Industrial/Commercial Use Codes used in WMIS. There are more codes listed, for reference, than appear in Table A-11.

1412	Cleaning and Maintenance	1701*	Closed Loop Heating and Cooling	1815	Lime Processing (Food, Fertilizer, etc.)
1423	Emission Control	1705	Aquifer Remediation	1820	Meat Packing
1425	Emission Control	1706	Water Well Contracting	1825*	Non-Power-Plant Non-Consumptive Cooling
1447	Power Plant Cooling Water Makeup	1710	Asphalt Manufacturing	1830	Perishable Food Processing
1467	Any Other Water Uses Not Listed	1720	Augmentation for Environmental	1835	Phosphate Chemical Processing
1468	Air Conditioning/Chillers	1725	Non-Power-Plant Boiler Makeup-Water	1840	Personal Sanitary Use
1469	Animals	1730	Non-Power Boiler Pollution Control	1841	Portable Use for Institutions
1470	Animal Watering	1735	Bottled Water	1845	Refrigeration
1471	Aquatic Habitat Fill	1736	Biofuels	1850	Truck Crop Packing
1472	Aquatic Habitat Water Change	1740	Cement Manufacturing	1855	Water Well Contracting
1473	Aquatic Habitat Water Replacement	1745	Cement or Cement Batch Plants	1856*	Reuse Water Quantities Received
1474	Augmentation for Aesthetic	1750	Cements or Cement Products	1857*	Reuse Water Quantities Used
1475	Fire Protection/Testing	1755	Chemical Manufacturing	1858	Water Used for Construction Purposes (Temp.)
1476	Lawn & Landscape Irrigation	1760	Citrus Packing	1859	Phosphate Gypsum Stack Closure
1477	Personal Sanitary Use	1765	Citrus Processing	1860	Power Plant Emission Control
1503	Evaporative Cooling	1770	Cleaning & Maintenance	1861	Power Plant Closed Cycle Steam Cooling
1504	Product Content	1775	Commercial Use (Car Washes, Laundry)	1862	Power Plant Once-Through Steam Cooling
1510	Product Washing	1780	Consumptive Cooling of Product	1863	Power Plant Boiler Feed and Makeup Water
1511	Product Mixing and Dilution	1785	Dilution	1864	Power Plant Personal/Sanitary
1512	Product Washing	1795	Fire Protection and Testing	1865	Power Plant Industrial-Other
1513	Process Water	1800	General Product Manufacturing	1866*	Power Plant Seawater Cooling
1519	Washing	1805	Industrial Other Uses	1867	Refrigeration
1700	Air Conditioning	1810	Lawn & Landscape Irrigation	1868	Any Other Water Uses Not Listed

\*Uses I701, I825, I856, I857, and I866 are excluded from the estimated water use query.

\* Data is only from the portion of the county within the District.

Source: Estimated Water Use Tables derived from the WMIS WUP database.

Data for the Mosaic Fertilizer multi-county permit (WUP 11400) were adjusted manually per well, so withdrawals are represented in the county where they occurred.

The average of monthly withdrawal totals from the WMIS database may vary from other tables due to MD/IC allocation adjustments on WUP 11400.

## 2022 ESTIMATED WATER USE REPORT

**Notes:**

- 1 Use Code: Alpha-numeric code to identify largest specific use attributed to the permit. The first letter indicates the “predominant use” (N = Institutional, O = “Other”). Each WUP may have multiple use codes, but largest specific use within the category is shown. Descriptions of the use codes are provided below.
- 2 Source = Groundwater (G) or Surface Water (S). The column also specifies if withdrawal quantity is based on metered data or estimation.
- 3 The share of Permitted Quantity allocated for the subject Predominant Use. If the value is less than the total permitted quantity, there is another predominant use allocated to the WUP. There may be additional withdrawals by the permittee for the other use on another table
- 4 The share of Permitted Quantity allocated for the subject Predominant Use. If the value is less than the total permitted quantity, there is another predominant use allocated to the WUP. There may be additional withdrawals by the permittee for the other use on another table.

Descriptions for the Institutional and “Other” Use Codes used in WMIS. There are more codes listed, for reference, than appear in Table A-13.

**Institutional Use Codes:**

N479	Augmentation for Aesthetic	N489	Decorative Water Features	N499	Personal Sanitary Use
N480	Golf Course	N490	Fire Fighting/Testing	N500	Power Plant Boiler Feed/Makeup Water
N481	Aesthetic use, not Augmentation	N491	Food Prep and Associated Water Needs	N501	Power Plant Closed Cycle Steam Cooling
N482	Augmentation for Aesthetic	N492	Fountains	N502	Power Plant Emission Control
N483	Augmentation for Environmental	N493	Maintenance & Cooling	N503	Power Plant Industrial-Other
N484	Lawn & Landscape Irrigation	N494	Non-PP Boiler Makeup-Water	N504	Power Plant Once-Through Steam Cleaning
N485	Sports Playing Fields	N495	Non-PP Non-Consumptive Cooling	N505	Public Drinking Fountains/Restrooms
N486	Air Conditioning/Cooling	N496	Non-PP Boiler Makeup Pollution Control	N506*	Reuse Water Generated on Site
N487	Cleaning and Maintenance	N497	Office/Staff Facilities	N507*	Reuse Water Received from a Utility
N488	Closed Loop Heating and Cooling	N498	Other "Institutional" Uses		

\* Specific uses N506 and N507 are excluded from estimated water use query.

**“Other” Use Codes:**

O508	Augmentation for Environmental	O509	Water for Aquatic Habitats	O510	Other "Other" Uses
------	--------------------------------	------	----------------------------	------	--------------------

<b>% of MIA</b>	30%	7%	0.1%	48%	15%	0.04%	100%
<b>* % of SWUCA Total</b>	11%	16%	0.3%	21%	44%	7%	17%
<b>** % of Districtwide Total</b>	9%	12%	0.3%	8%	27%	0.9%	10%

Source: Estimated Water Use Tables derived from the WMIS WUP database and 2022 PSARs.

Data is only from the portion of the county that is within the MIA. Table does not include Domestic Self-Supply.

<sup>1</sup> The Manatee County public supply WUP 13343 permits surface water withdrawals that are within the MIA (Lake Manatee) and groundwater withdrawals from wells located outside of the MIA. The WUP's surface water withdrawals are included above, but the groundwater withdrawals are not. This adjustment was first applied to the 2016 EWU Report, which may result in an apparent increase of surface water from 2015 and earlier when comparing historical data.

\* SWUCA Totals, for percentages on the second-to-bottom row, are from Table B-2.

\*\* Districtwide Totals, for percentages on the bottom row, are from Table B-1.

<b>*DPC WUCA % of Districtwide Total</b>	7%	4%	0.3%	6%	1%	0.1%	5%

Source: WUP database, permitted quantities queried at end-of-year.

Data is only for the portion of the county that is within the MIA.

\* Districtwide Totals, for percentages on the bottom row, are from Table C-1.

<sup>1</sup> WUP #4352 is a Public Supply WUP in Hillsborough County for a wellfield that partially overlaps the DPC WUCA boundary.

The total permitted allocation of 24.1 mgd is included in the table.

<sup>2</sup> The Mosaic Integrated WUP #11400 had two active wells within the DPCWUCA boundary, to which proxy permitted quantities of 1.242 mgd were allocated for Industrial use.

Source: Prior EWU Reports and Table A-1.

Notes: A dot (".") represents a lack of data for a specific year. This may occur if a permit was issued less than ten years ago, or the permit no longer exists, or the PSAR was no longer required. Acronym "NA" (Not Applicable) is shown for Service Area Population where the value was not calculated because the permit was not active in 2022.

Source: Prior EWU Reports and Table A-1.

Notes: A dot (".") represents a lack of data for a specific year. This may occur if a permit was issued less than ten years ago, or the permit no longer exists, or the PSAR was no longer required. Acronym "NA" (Not Applicable) is shown for Service Area Population where the value was not calculated because permit was not active in 2022.

## **2022 ESTIMATED WATER USE REPORT**

### **Notes:**

GPCD = gallons per capita per day, GPD = gallons per day, MGD = million gallons per day, NA = Not available.

If the PSAR was not received, withdrawal totals were based on reported annual metered pumpage (WMIS) and dwelling units served.

- 1 GW = ground water, SW = surface water, DS = Groundwater Desalination (Reverse Osmosis or Electrodialysis)
  - 2 IMPORT = Water purchased or transferred from another utility or regional water supply authority.
  - 3 EXPORT = Water sold or transferred to another utility.
  - 4 TREATMENT LOSS = Annual average gallons per day which are lost in routine treatment for potability. This includes, but is not limited to, desalination reject water, sand filtration backwash, and quantities used to maintain appropriate water quality in pipelines or tanks. Treatment losses are calculated as raw water into the plant minus treated water out of the plant. In addition, this can include no more than 1% of treated water volume delivered to the distribution system for flushing distribution lines for potability.
  - 5 GROSS USE (aka "finished") = (withdrawal) + (import) - (export) - (treatment loss).
  - 6 HOUSING UNITS SERVED = Housing units served reported by the utility. If no annual data was submitted, the estimated housing units served was based on parcel-level BEBR-MED projections published in 2022 (GIS Associates) ÷ U.S. Census Persons Per Household.
  - 7 AVG PPH = U.S. Census Persons Per Household by utility service area. The source data is available under Section B-2 at:  
<https://www.swfwmd.state.fl.us/resources/data-maps/section-b-data-and-methods-estimating-service-area-population-served>
  - 8 RESIDENTIAL POPULATION SERVED = (housing units served reported by the utility) \* (Census utility service area average persons per household). If no annual data was received, the estimated housing units served was based on parcel-level BEBR-MED Projections published in 2022 (GIS Associates) ÷ U.S. Census Persons Per Household.
  - 9 DEP GROSS PER CAPITA = (gross use) / (residential population served). Population-related withdrawals associated with residential, business, institutional, industrial, miscellaneous metered, and water loss uses are applicable to all public supply permits.
  - 10 RESIDENTIAL USE = Use reported by utility for only residential purposes. If no data was received, the countywide percent residential use was applied.
  - 11 RESIDENTIAL PER CAPITA = (residential use) / (residential population served).
- \* The utility is a wholesale water importer. Most or all of the water used was purchased from a regional water supply authority or another utility.
- \*\* Sarasota County Utilities combines three WUPs for public supply annual reporting: #4318, #10224, and #10225.

**2022 ESTIMATED WATER USE REPORT**

**APPENDIX F**

**ESTIMATED WATER USE REPORT  
HISTORY AND METHODOLOGY**

## **2022 ESTIMATED WATER USE REPORT**

### **WUP METERING REQUIREMENT HISTORY**

Prior to 1989, metering was only required on WUPs with permitted quantities for 500,000 gpd or more (on an annual average basis). Between 1989 and 1992, metering was required on all WUPs for 100,000 gpd or more in the Northern Tampa Bay Water Use Caution Area (NTB WUCA) and in parts of the Southern Water Use Caution Area (SWUCA), formerly known as the Eastern Tampa Bay WUCA and Highlands Ridge WUCA. The District established a cost-reimbursement program for meter installations, and by January 1992 all WUPs with required metering were metered. The SWUCA was established in 1992, replacing the Eastern Tampa Bay WUCA and the Highlands Ridge WUCA and including the counties between them. Metering requirements for WUPs allowing 100,000 gpd or more were added to the new areas in the SWUCA. Permittees began installing these meters (under another meter cost-reimbursement program) beginning in 1995. By 2003, all permits in the SWUCA with the new metering requirement were metered. In 2007, the NTB WUCA was expanded to include all of Pasco County and the remaining portion of Hillsborough County that was not in the SWUCA. Metering conditions were applied to all WUPs for 100,000 gpd or more on an annual average basis in the added area of Pasco and Hernando under another meter cost-reimbursement program by the District.

Currently, the more lenient metering requirement at 500,000 gpd or more still exists for WUPs other than public supply in the northern District portions of Lake, Marion, Citrus, Sumter, Hernando, and Lake Counties, and a portion of Polk County north of the SWUCA boundary. This results in a proportionately greater number of estimated WUPs in the northern District. Metering may still be required for smaller WUPs as a special condition if the withdrawals have the potential to impact sensitive water bodies, water resources, or other legal users.

Rules for the Dover/Plant City WUCA were implemented in 2011. These rules require meters to be installed on all withdrawal points permitted for freeze protection quantities or permitted for a use that typically requires freeze protection. The District is assisting the affected permittees with the cost of purchase and installation for automatic meter reading (AMR) devices on new or existing meters. The District also pays the subscription costs to have a vendor transmit the AMR data to the District in real time.

### **WATER USE PERMIT BUSINESS RULES AND CONSTRUCTION**

Every active water use permit (WUP) has at least one existing or proposed withdrawal point, one water demand use code, and a total permit allocation in annual average quantities. Each of the active withdrawal points on the WUP have their own permitted allocation, and the sum of those withdrawal allocations should equal the WUP's total permitted quantity, with some exceptions for large WUPs that are allowed to rotate their withdrawal allocations. Also, the use type allocation(s) for each withdrawal point should be equal to the permitted allocation for that withdrawal point. Some WUPs also have maximum daily and peak month permitted quantities assigned.

The withdrawal points are either groundwater wells or surface water withdrawal intakes. Each withdrawal point is described in the District's Water Management Information System (WMIS) database by codes that define its type, location, purpose, and intended use. These codes facilitate analyses for the annual EWU Reports.

All WUPs have a defined water use demand. The specific water use demands are codified by a series of four-digit *water use codes* that describe the purpose of the withdrawal. There are over 300 water use codes currently utilized in WMIS. Use code definitions are listed in the footnotes of the Appendix A tables. These codes are alphanumeric, and the letter prefix of the code defines which predominant water use category it belongs to:

The larger WUPs often have multiple use codes catalogued, and some withdrawal points may have more than one use code. To prevent the EWU Report from being overly complicated, many uses shown in tables are grouped together by use codes with similarities. For example, a farm's WUP could be permitted for irrigation of a mixture of crop types including citrus, broccoli, and carrots; along with potable water from a separate well provided to farm worker housing. In the EWU Report, the water use for crops will be in the "agriculture" category with citrus irrigation in its own "Citrus" use group, the quantities for broccoli and carrots will be combined under the "Vegetables" use group, and the potable water use will be counted separately in the "Public Supply" category.

Large public supply utility WUPs don't have use codes assigned at the withdrawal points because the utilities distribute water to various customer types within their service area. Instead, the utilities annually provide customer type information in their Public Supply Annual Reports (PSARs). The customer type information from the PSARs is published in Appendix A, Table A-2.

WMIS uses several other alphanumeric codes to define WUP and withdrawal point characteristics. WUP attributes that are queried for the EWU Report include the permit number, revision number, issue date, delete date, active status code, county, water use caution area, total permitted annual average, and maximum daily quantities. The queried withdrawal point attributes include site ID numbers, withdrawal type, status, use function, operation code, permitted annual average and maximum daily quantities, latitude/longitude, county, and codes for metering and pumpage conditions. The water use codes for each WUP are queried and stored in a parallel dataset and include the predominant and detailed use type, a use ID number, and permitted quantity per detailed use.

All WUPs have revision numbers which track the former, current, and proposed versions of the WUP, and the revisions have a status code to indicate which revision is currently active. When a new WUP application or modification request is received, it's given a status of "Submitted." When the WUP is officially issued and active, the status is changed to "Approved." Former inactive WUPs may have a status of "Expired," "Cancelled," "Withdrawn," or "Denied." The permitted quantities described in this report are based on the active WUP revisions at the end of the year. WUPs that officially expired before the end of year may still be listed in the report to include their withdrawals; or, if the withdrawal points were transferred to a different WUP, the prior withdrawals may be counted with the new WUP.

### **ESTIMATED WATER USE REPORT METHODOLOGY**

A suite of SAS programs is used to extract and process WUP data from the WMIS database. These program scripts were initially created in 1994 and have been modified over time to conform with District boundaries, updated coding, and some changes to what data is queried or excluded during analysis. The basic methodology hasn't changed much and is described below.

#### **Data Capture**

A "permit snapshot" of active WUP permit records is taken at the end of each calendar year because the permit codes may change daily as WUPs are approved, modified, or expire. The end-of-year snapshot becomes the EWU database for permit-related data.

## **2022 ESTIMATED WATER USE REPORT**

At a later date, a second “pumpage snapshot” acquires meter-based data for the active WUP withdrawals. It can take several weeks after year’s end for all pumpage to be reported and inputted to the WMIS database. Additionally, pumpage may be corrected in the following months as quality-control activities are performed. So, the pumpage snapshot is occasionally updated over the following months to acquire the latest pumpage data. The pumpage data used for the 2022 EWU Report was last queried on October 26th, 2023.

### **Data Filtering**

Sets of SAS programs apply filters to the permitting codes to remove WUPs, withdrawal points, and use types that do not pertain to withdrawal directly from natural resources. Only groundwater and surface water withdrawal points are kept, and only existing and proposed withdrawal points are kept. Reclaimed water sources and repumped quantities from augmented storage ponds are excluded. Withdrawal points with the following use type codes are excluded to avoid counting alternative water sources or double-counting recirculated water:

<b>A705</b>	Dewatering to On-Site for Agricultural Purposes
<b>P011</b>	Augmentation for Replacement Quantities
<b>P085</b>	Significant Use (identifies major public supply utility customers)
<b>P110</b>	Quantities Supplied by External Source
<b>P170</b>	Reuse Water Provided to Customers W/I Service Area
<b>P175</b>	Reuse Water Supplied W/I Service Area not for Use
<b>P180</b>	Reuse Water Provided to Customers outside of Service Area
<b>R400</b>	Reuse Water Received from a Utility
<b>R401</b>	Reuse Water Generated on Site
<b>R405</b>	Closed Loop Heating and Cooling
<b>I417</b>	Closed Loop Heating and Cooling
<b>I701</b>	Closed Loop Non-Consumptive Heating and Cooling
<b>I825</b>	Non-Power-Plant Non-Consumptive Cooling
<b>I856</b>	Reuse Water Quantities Received
<b>I857</b>	Reuse Water Quantities Used
<b>I866</b>	Power Plant Seawater Cooling
<b>M985</b>	Recirculated Mining Quantities
<b>N506</b>	Reuse Water Generated on Site
<b>N507</b>	Reuse Water Received from a Utility

The following “withdrawal point function codes” are excluded from the EWU query because they pertain to unregulated sources or injected/recharged water:

<b>D</b>	Domestic
<b>GI</b>	Geothermal Injection
<b>J</b>	Injection
<b>RC</b>	Recharge of aquifer with no recovery
<b>RP</b>	Repump withdrawal point

The following “withdrawal point operation codes” are excluded from the EWU query because they do not pertain to natural resources or have minimal impact:

<b>AR</b>	Alternative source plus repump
<b>AS</b>	Aquifer Storage and Recovery
<b>AW</b>	Alternative water supply that is neither reclaimed water nor captured stormwater
<b>CB</b>	Dewatering quantities that are recycled on-site
<b>CL</b>	Closed loop heating or cooling
<b>EF</b>	Effluent line into property (typically reclaimed water imports)

## **2022 ESTIMATED WATER USE REPORT**

<b>F</b>	Foundation test well (very short-term use)
<b>FM</b>	FARMS reservoir pumpage
<b>MR</b>	Mixed repump of surface water and alternative source
<b>O</b>	Observation well aquifer test
<b>RS</b>	Repump of groundwater plus stormwater
<b>RU</b>	Repump of reclaimed water
<b>SR</b>	Surface water plus repump of groundwater
<b>ST</b>	Stormwater received from another entity
<b>T</b>	Test well
<b>TR</b>	Tailwater recovery

The operation codes for rotational (**RI**) and standby (**SB & SA**) withdrawal points identify wells that allow occasional, flexible water use. If used, their pumpage is included in the tally of withdrawals, but their permitted quantity isn't added to the WUP's total permitted quantity. Likewise, withdrawal points operated for crop freeze protection only (**EC**) will have their withdrawals included, but the EWU datasets have changed their permitted quantity to 2 gpd as an identifiable placeholder.

### **Data Correction and Quality Control**

The District's review of EWU data serves as an opportunity for staff to identify and correct permit coding errors and address questionable pumpage records. The EWU Report author communicates issues with WUP compliance staff, and parallel corrections may occur to both the WMIS database and the draft EWU datasets.

The EWU permit datasets are checked by running a series of SAS programs that look for incongruities to the business rules for WUPs. When errors are identified, they are fixed using SAS correction scripts to modify the EWU dataset and archive the changes made. The original permit snapshot data is archived on a District network drive for historic record. The SAS correction and check programs are rerun through multiple iterations until the check programs show zero errors. Found errors are communicated to regulatory staff where they are vetted before being corrected in the WMIS database. Most issues involve internal coding or small changes that seldom require the WUP to be revised.

On WUPs that have water repumped from irrigation ponds, the water use codes are sometimes assigned to repump withdrawal points instead of the wells/intakes from natural resources that augment the irrigation ponds. This is okay from a regulatory perspective, but it complicates the EWU query because repump withdrawal points are excluded. The author remedies this issue by using scripts to reassign proxy use codes in the EWU data to the augmentation withdrawal points. Proxy use codes are also used for a few large WUPs that allow rotational use of permitted quantities among several withdrawal points.

The EWU author will search for and include any WUPs issued near the end of the year, which might not be fully entered into the WMIS database by staff before the snapshot. The author will also find withdrawal points that were transferred or consolidated into another WUP during the year. The old WUP's permit quantity is typically not counted, but any pumpage on the old WUP's transferred withdrawal points may be allocated to the new WUP's annual withdrawals.

Once the permit-level checks are complete, the EWU permit dataset's withdrawal points provide a template for querying the monthly pumpage. Some withdrawal points have daily-reported pumpage in WMIS which is converted to monthly averages. The pumpage data is checked by searching for outlier quantities, such as monthly pumpage of a certain magnitude higher than the permitted quantity, or significantly different from other months when it's known the water demand is consistent. Unfortunately, pumpage errors with apparently reasonable values may go undetected. Unrealistic pumpage values are sent to regulatory staff for review and confirmation.

## **2022 ESTIMATED WATER USE REPORT**

Any changes to WMIS pumpage records require the permittee’s written approval. If corrections are made in the WMIS database, they can be captured when the pumpage snapshot is rerun. If the approval is not acquired, or a correction can’t otherwise be made before the final pumpage snapshot, the EWU author may take liberty of inserting a more realistic value in the EWU pumpage dataset.

### **Data Compilation and Estimations**

The reviewed EWU permit and pumpage datasets are processed by SAS programs that sum by predominant use categories and calculate water use estimates for all non-metered withdrawal points. The estimates are based on withdrawn/permited ratios of metered withdrawal points. Some adjustments and grouping are necessary to generate effective ratios.

*Scaling:* If a WUP’s multiple withdrawal points have permit quantities that do not sum equal the WUP’s total permitted quantity, a “scaled” permitted value is automatically applied to each withdrawal point on the WUP to match the permitted quantity. The scaled quantity is used for calculating permitted quantities for specific use categories and for estimating pumpage on non-metered withdrawal points.

*Fractioning:* WUPs coded with two or more predominant use categories have their withdrawal totals fractioned based on the permitted quantity for each predominant use. The calculated shares are assigned to the use categories in the EWU tables and charts. This simplifies the data processing but can potentially create inaccuracies. For quality assurance, the author reviews several significantly large WUPs by comparing the calculated shares to audits of metered wells with specific uses identified, and adjusts data where appropriate.

*Quantity Tiers:* For estimation purposes, all active withdrawal points are assigned one of four “tiers” according to the withdrawal point’s permitted quantity:

<i>Size Tier #</i>	<i>Permitted Quantity</i>
Tier 1:	< 50,000 gpd
Tier 2:	50,000 to 100,000 gpd
Tier 3:	> 100,000 to < 500,000 gpd
Tier 4:	500,000 gpd or more.

The four size tiers are applied to each of the seven predominant use categories, making 28 “use-tier” groups. The groups are further sorted into monthly blocks. A ratio for each block is calculated based on the representative metered/permited quantity. All metered withdrawal points are included in the process of determining the pumped/permited ratios. Ratio values are sorted into an ordered distribution from smallest to largest ratio for statistical analysis.

In a normal distribution, the 50<sup>th</sup> percentile (median) is equal to the average (mean) value. If the distribution is skewed, the median is not equal to the mean. The metered/permited ratio distributions are typically skewed to the right (i.e., the mean average is greater than the median). At the low end of the distribution, pumpage data includes zeros for withdrawal points that are unused or unrecorded. At the high end, some ratios could be much greater than 1.0 due to over-pumpage or erroneous outliers. To negate the effects that bad end-values can have on the mean average, percentiles are used to select the most plausible ratios for estimation. A range of percentiles from the 50<sup>th</sup> through the 80<sup>th</sup> within the distribution are analyzed, and a percentile for each use-tier is selected that generates a feasible fit between mean and median values over the 12 months. A SAS graphing program is used to evaluate each use-tier. The monthly ratios in each use-tier that were used for the 2022 EWU Report are provided in Table F-1 below.

## 2022 ESTIMATED WATER USE REPORT

**TABLE F-1. Monthly pumped/permited Ratios used for Water Use Estimates, 2022**

Predominant Use Type	Size Tier	Monthly Ratios												Annual Ave	Metered Percentile
		1	2	3	4	5	6	7	8	9	10	11	12

*Estimating Withdrawals for Unmetered WUPs:* All the active non-metered WUP withdrawal points are assigned a use-tier. A SAS program multiplies each non-metered withdrawal point's scaled permit quantity to the corresponding ratio to estimate its monthly pumpage. The monthly estimates, as opposed to annual estimates, are generated to provide data that the District can use for simulating monthly well pumpage in hydrologic models and for other scientific purposes.

*Final Compilation:* SAS programs combine the metered and estimated monthly pumpage data to compile the annual average withdrawal totals per predominant and detailed use categories, water source, county, and water use caution areas. Tables and WUP listings are generated that are close to the final versions contained in the report. The author uses the program output to generate much of the charts, tables, and appendices, but also audits many of the large or complicated WUPs for comparison and adjustments.

Water utility data from the Public Supply Annual Reports (PSARs) is reviewed by staff for compliance and demographic analysis. PSAR data is a primary source for the public supply tables, but the PSAR data is cross-checked with the SAS output for quality assurance. More information on PSARs is below and in the public supply chapter.

Since the domestic self-supply withdrawals are not permitted, nor have pumpage records, the estimates must be calculated separately and are discussed below.

## **2022 ESTIMATED WATER USE REPORT**

### **DOMESTIC SELF SUPPLY (DSS) ESTIMATIONS**

The water use in the DSS category represents small domestic wells for potable supply at rural residences. DSS water use is not regulated by the District, as the wells typically have 4" diameter casings and withdraw small quantities that are below regulatory thresholds. Privately owned DSS wells typically do not have a meter, and pumpage records are not available to apply the estimation methods described above. As an alternative, the EWU Reports have provided a population-based estimate of DSS quantities since 1982. A "rural population" value for each county is multiplied by the county's average residential per capita use for public supply (from Table A-2) to estimate the DSS use quantity for each county.

Since 2014, the counties' rural population is calculated using a GIS-based analysis of census parcels located outside of utility-served areas. The rural population data was queried from a U.S. Census parcel-level, centroid-point based, population shapefile including permanent/seasonal, tourist, and net commuter populations. The census points were clipped inside the District boundary and outside of polygons for active public supply utility service areas. The GIS shapefiles are available under "Demographics" on the District's Geospatial Data Portal:

<https://data-swfwmd.opendata.arcgis.com/>.

The countywide self-supplied population was multiplied by the countywide average residential water use per capita (from Table A-2). It's assumed that the residential per capita effectively accounts for weather influences on outdoor water use during the year.

This DSS methodology does not account for residential irrigation use by public supply utility customers who use small wells for irrigation only. If needed, such estimates are projected in 5-year increments in the District's Regional Water Supply Plan, Appendix 3-3, Table 23, available at:

<https://www.swfwmd.state.fl.us/resources/plans-reports/rwsp>

### **UTILIZATION OF PUBLIC SUPPLY ANNUAL REPORTS**

The EWU Reports include data from the PSARs that are submitted by the larger public supply utilities. A permittee having a public supply WUP issued for 100,000 gpd or greater is required under Chapter 40D-2, Florida Administrative Code (F.A.C), to submit a PSAR by April 1 of each year. A considerable amount of staff time is placed into review of the PSARs, and the data is used to support water supply planning, water use permitting, and water conservation. Historically, some discrepancies have occurred between the PSAR-sourced public supply withdrawals and those calculated from the WMIS monthly pumpage records. The PSAR data was used as the principal source for public supply withdrawals and use in this report. Nearly all discrepancies between the WMIS and PSAR withdrawal data were reconciled by District and utility staff prior to publication. Some differences between the official PSAR submittals and values in Appendix A of this report for permittees are possible, due to the authors' liberty to provide the best estimates of water use within the calendar year. PDFs of the official PSAR submittals can be downloaded by finding the WUP with the District's Permit Mapping tool at the link below. Select the permit area, the WMIS hyperlink "More Info," then look under the "documents" tab for "Public Supply Annual Report" or "Public Supply Survey."

<https://www.swfwmd.state.fl.us/business/epermitting/water-use-permit>.

**2022 ESTIMATED WATER USE REPORT**
